# The Best Kept Secret in Data Logging ...

## ...is right in your PC.

For 15 years, engineers and scientists have built increasingly flexible data logging systems using National Instruments data acquisition (DAQ) hardware and LabVIEW™ software.

Now NI introduces VI Logger, our ready-to-run, configuration-based data logging software for use stand alone or within LabVIEW. With VI Logger, you can:

- Easily log, view, and share data
- Interface to more than 100 DAQ and signal conditioning devices
- Export data to Microsoft Excel
- Migrate your logging tasks to LabVIEW for analysis, Web publishing, and more.

**Unlock the secret. Download VI Logger for a FREE 30 day trial.**

[ni.com/info](http://ni.com/info)

Visit [ni.com/info](http://ni.com/info) and enter na2c01 to download an evaluation version of VI Logger for a free 30-day trial and to run a brief VI Logger demo presentation.

# Complex calculations are hard.

Mathcad® 2001 is the most powerful tool for applying mathematics. It is the backbone for your technical desktop applications. Reach solutions, document work, and analyze results the way more engineers and organizations do.

With Mathcad 2001, you get faster performance, enhanced Web publishing and workgroup collaboration tools, powerful simulation and modeling capabilities, full compatibility with the Microsoft® Office suite, MATLAB®, AutoCAD®, and much more — all with the stability and connectivity that make all your technical projects run faster and smoother, from start to finish.

## New **Mathcad** 2001

Better. Faster. More Powerful.

Also available from your favorite corporate resellers:

**Mathcad 2001 Professional** includes IBM techexplorer™ Hypermedia Browser - Professional Edition, SmartSketch® LE, Volo™View Express and VisSim LE. With **Mathcad 2001 Premium** you get everything above plus Axum®, SmartSketch 3 and the Solving & Optimization Extension Pack. Mathcad 2001 runs on Windows 95, 98, 2000 and Windows NT 4.0 or higher. Volume and academic licensing is available.

To order call 1-800-628-4223 or go to [www.mathcad.com](http://www.mathcad.com)

## FEATURES

- 16 MEMS: Smaller is the Next Big Thing
- 22 InReview
- 64 Application Briefs

## SOLUTIONS

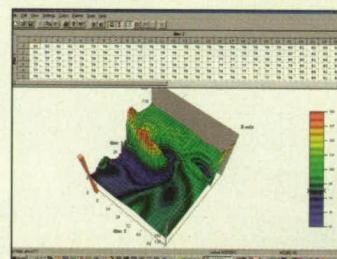

### 28 Special Coverage: Computers & Peripherals

- 28 The NASA Spacecraft Transponding Modem
- 28 Analog VLSI Circuits for Hebbian Learning in Neural Networks
- 30 Compact, Rugged Enclosure for PC-Based Electronic Circuits
- 32 Design of a Highly Reliable Controller for an I<sup>2</sup>C Bus
- 33 Advances in Parallel Computing on Adaptive Grids

### 34 Electronic Components and Systems

- 34 Full-Spectrum Arraying of Receiving Radio Antennas
- 36 Array of Nanoklystrons for Frequency Agility and Redundancy
- 39 Log-Ratio Circuit With Enhanced Temperature Stability
- 40 Millimeter-Wave Dichroic Plates for High Angles of Incidence

22

56

### 42 Software

- 42 Computing Diffusion in High-Temperature Coating Layer
- 42 Software for 3D Graphics With Time- and Cost-Saving Features

## DEPARTMENTS

- 10 Commercial Technology Team
- 12 UpFront
- 14 Reader Forum
- 15 Technologies of the Month
- 24 Who's Who at NASA
- 26 Commercialization Opportunities
- 62 Advertisers Index

### 44 Materials

- 44 Obtaining Consistent, Reliable Results in Elastomer Seal Testing
- 45 Making Ion-Accelerator Grids From Ti Instead of Mo

## NEW FOR DESIGN ENGINEERS

- 54 Web Sites
- 55 Software
- 56 Products
- 57 Literature

### 46 Mechanics

- 46 Quasi-Fractal Lenticular Booms
- 46 Vacuum Pumping Station
- 47 Nonintrusive Pressure Gauges
- 48 PVP-MP Method for Wrinkling Analysis of Space Membrane Structures

## SPECIAL SUPPLEMENT

### Motion CONTROL Tech Briefs

a penny

## WHAT ARE MEMS?

Micro Electro Mechanical Systems (MEMS) are micromachines the size of a grain of salt or the eye of a needle that integrate mechanical elements, sensors, actuators and electronics on a common silicon substrate. MEMS applications include optical switches within telecommunication and networking systems, accelerometers in automotive airbags, inkjets in desktop printers and sensors in medical testing equipment.

The emerging MEMS industry promises to make the next generation of electronic products smarter and cheaper.

ALGOR's direct-selling and high-technology business model delivers the best FEA-based simulation value for MEMS simulation in the CAE industry. ALGOR's MEMS solution links electrostatic analysis to structural analysis tools with an easy-to-use graphical user interface that works within many popular CAD systems and includes a precision FEA model building tool.

### ALGOR'S MEMS SOLUTION INCLUDES:

- Multiphysics analysis software to simulate the real-world mechanical behavior for several physical factors acting simultaneously, such as:
  - Electrostatic analysis software that calculates forces due to surface charges
  - Mechanical Event Simulation for virtual replication of dynamic events with linear and nonlinear material models that predicts electromechanical effects driven by electrostatic forces
  - Structural analysis software that predicts electromechanical effects driven by electrostatic forces
  - Piezoelectric material models for Mechanical Event Simulation and static stress analysis
  - Composite material models for Mechanical Event Simulation and static stress analysis
  - Thermal analysis for considering the effects of heat transfer
  - Fluid flow analysis for considering the effects of fluid dynamics
- An easy-to-use graphical user interface that enables engineers to directly apply electrostatic forces to a structural model and provides right-click functionality for applying, modifying and removing loads, constraints and finite element properties
- Built-in precision FEA model building capabilities with geometric scaling and structured meshing capabilities
- InCAD technology for CAD/CAE interoperability within Autodesk Inventor, CADKEY, Mechanical Desktop, Pro/ENGINEER for Windows, Solid Edge and SolidWorks
- Unstructured brick and tetrahedral meshing
- A midplane mesh engine that automatically converts thin solid parts into plate/shell elements
- A Material Library Manager that controls material property data for all analysis types

## PRODUCT OF THE MONTH

VX CAD/CAM Version 5 software from VX Corp., Palm Bay, FL, features automatic healing of imported solid models, and direct import/translation of Parasolids files.

12

## ON THE COVER

German-based Fella-Werke GmbH used Solid Edge CAD software from UGS ([www.solid-edge.com](http://www.solid-edge.com)) to design this rotational drive assembly for a piece of agricultural machinery. Version 10 of Solid Edge features enhancements that focus on these types of large-assembly designs, including a drawing view tracker, pipe threading, and part/feature/assembly color options. For more on the latest version of Solid Edge, see New on Disk on page 55.

## If it's vibration, pressure or shock, we measure it.

### Signal Conditioner for Piezoelectric/ISOTRON® Sensors - Model 133

- Multi-Purpose 3-Channel Signal Conditioner
- Selectable Filter Options
- 100 kHz Bandwidth
- RS-232 Serial Interface
- Excellent Value

### 10mm-Cube Triaxial Accelerometer - Model 65

- Measures in all 3 axes
- Sensitivity 10 or 100 mV/g
- Lightweight 5 gm
- 10 kHz Frequency Response
- Single Output Cable

Endevco's products are used throughout the world - in aerospace, defense, automotive, test laboratories and jet engine test cells. We have signal conditioning to meet the needs of bench-top, single channel, multi-channel computer controlled and even the newest technology of the IEEE-1451.4 Smart Sensors. So if you've got a challenge, call the dedicated people of Endevco.

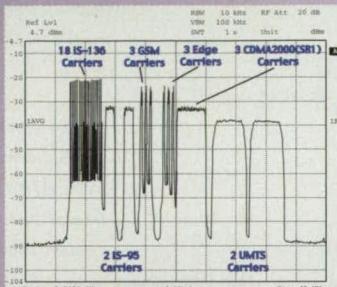

WHAT CAN WE DO FOR YOU TODAY?

11.4 dB Crest Factor

The CS2010VSG  
Direct-To-IF  
Signal Generator

## A New Approach For Power Amp Testing

- Best ACP Measurement Capability
- Simultaneous Multi Carrier - Multi Standard

A new standard for amplifier test has been set with Celerity's CS2010 Vector Signal Generator. This modular, future-proof instrument utilizes a direct-to-IF architecture to support multi-carriers, and 50x more memory to support multi-standards. Add to that the best dynamic range available today!

If you are developing GSM, EDGE and UMTS/3G, the CS2010 is your answer for fast, accurate measurement capability.

Call today at 888-274-5604 or visit [www.celeritydbt.com](http://www.celeritydbt.com) to learn more and request our "Spectral Performance" App Note.

## FLAWLESS IN ANY ENVIRONMENT

### THE MILITARY DEPENDS ON STORCASE DATA EXPRESS®

removable drive enclosures for reliable performance. In addition to being used to collect low gravity acceleration measurements during NASA Space Shuttle missions, Data Express removable drive carriers are used in many military land, air and sea applications. From the simplest removable drive application to the most complex RAID implementation, StorCase has a solution to meet your unique storage requirements. Call a StorCase representative today at **(800) 337-8421** to find out more about the Data Express — one of the toughest removables in any environment.

NASA's R&D efforts produce a robust supply of promising technologies with applications in many industries. A key mechanism in identifying commercial applications for this technology is NASA's national network of commercial technology organizations. The network includes ten NASA field centers, six Regional Technology Transfer Centers (RTTCs), the National Technology Transfer Center (NTTC), business support organizations, and a full tie-in with the Federal Laboratory Consortium (FLC) for Technology Transfer. Call (609) 667-7737 for the FLC coordinator in your area.

## NASA's Technology Sources

If you need further information about new technologies presented in *NASA Tech Briefs*, request the Technical Support Package (TSP) indicated at the end of the brief. If a TSP is not available, the Commercial Technology Office at the NASA field center that sponsored the research can provide you with additional information and, if applicable, refer you to the innovator(s). These centers are the source of all NASA-developed technology.

If you are interested in information, applications, and services relating to satellite and aerial data for Earth resources, contact: Dr. Stan Morain, **Earth Analysis Center**, (505) 277-3622.

## Thank you, NASA.

When you do outstanding work, you're bound to stand out. We at Swales Aerospace thank NASA for recognizing our efforts with the George M. Low award. NASA awarded us their highest honor for the quality and technical performance we displayed in the products we delivered—including the integrated EO-1 spacecraft, the multi-segmented Mars deep-drill demonstration unit, the FUSE telescope assembly, and the 21-foot-long integrated radiator/heat pipe panel for the ISS. We take great pride in providing world-class products, engineering and systems solutions for the global satellite industry. And we are especially proud of the people at Swales who make it all happen. To find out how we can help you, contact Art Chomas at (301) 902-4330 or [achomas@swales.com](mailto:achomas@swales.com).

# UpFront

## PRODUCT OF THE MONTH

**V**X Corp., Palm Bay, FL, has released Version 5 of VX CAD/CAM, a design-through-manufacturing software package that features new functions and enhancements.

Included are manual and automatic healing of imported solid models; direct import/translation of Pro/E, CATIA, and Parasolid files; unified filleting with a single command; lofting for complex shapes; and

advanced mold and sheet metal design and manufacturing. New surface creation tools allow users to decide how much attraction or gravity to apply to problem curves, eliminating deformities. The user interface for the new version has been enhanced to comply with Windows standards. The software was designed to integrate product design and manufacturing to eliminate the gap between CAD and CAM packages. Manufacturing planning and CNC machining routines are an integral part of the VX modeling engine.

## NASA Licenses Mapping Software

**A** new radar mapping technology designed to generate high-resolution 3D maps of Earth beneath foliage and other vegetation has been licensed by NASA's Jet Propulsion Laboratory (JPL) in Pasadena, CA, to EarthData International of Fresno, CA. This is the first system that will be able to map above, through, and below the vegetation canopy to provide information on landslides that are overgrown with vegetation.

The Geographic Synthetic Aperture Radar (GeoSAR) mapping system uses radar to operate both day and night, under almost any weather condition. JPL designed and constructed the radar systems and the processing software. After the system is fully tested, EarthData plans to provide GeoSAR

mapping services to both military and commercial customers.

The system uses interferometric radar remote sensing and combines X-band and P-band (UHF) radar waves. The shorter wavelength X-band radar measures near the tops of trees, and the longer wavelength P-band penetrates the foliage. The system can produce elevation models with vertical accuracies to 1 to 5 meters. Federal, state, and local government agencies, as well as other organizations, may use GeoSAR data to understand seismic changes in forests, assess forest fire damage, measure timber

volume, and help in environmental protection and flood plain management.

For more information visit <http://southport.jpl.nasa.gov/html/projects/geosar/geosar.html>

This digital elevation model of Los Angeles County, CA, is typical of the data that will be produced with the GeoSAR system. This model is used to identify potential earthquake hazards.

## What's New On-line

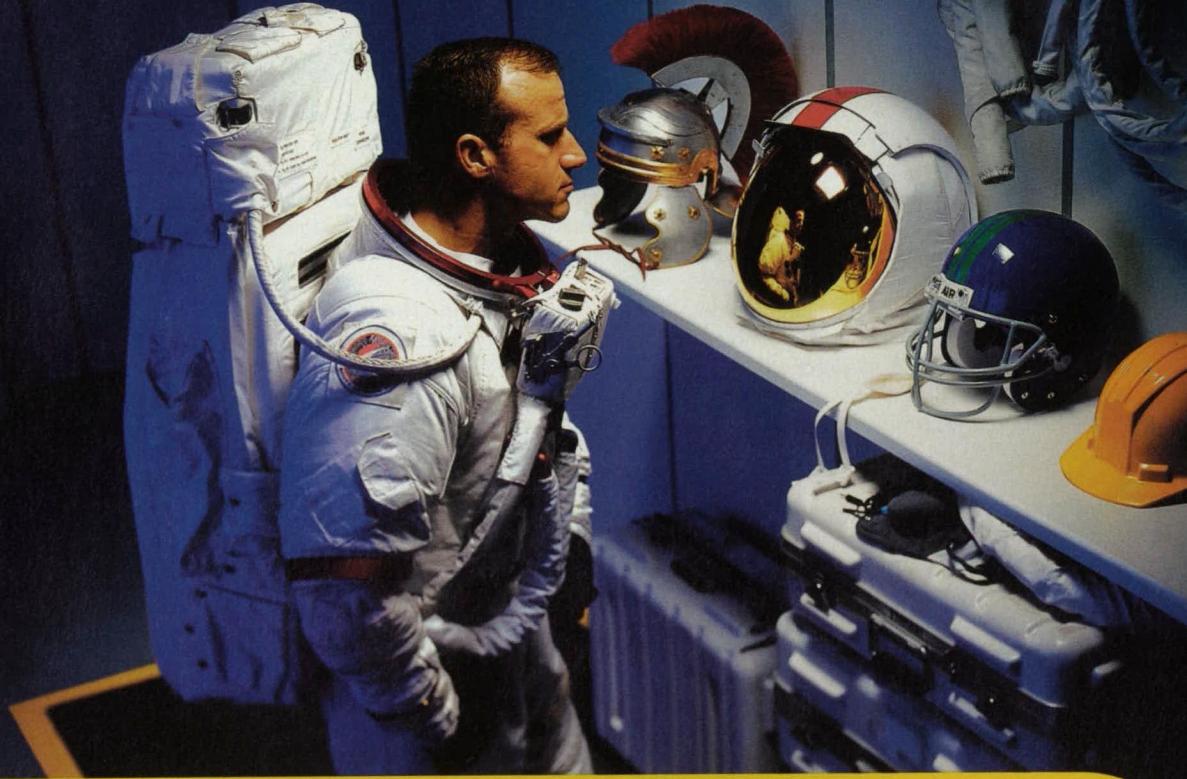

• What's new is what's next: the X Internet. The "Executable Internet" adopts the XML standard, and will become the dominant way we interact with the Net by 2005, according to Forrester Research. The X Internet will replace browsers and static Web pages with a much richer, interactive experience. And speaking of interactive experiences, you can access the full story on the X Internet by visiting the *NASA Tech Briefs* Web site at [www.nasatech.com/features](http://www.nasatech.com/features). There, you'll find out about the first and second stages of the X Internet, how it will affect all aspects of business, which types of vendors will be the biggest winners in developing applications, and what your company can do to prepare for the X Internet.

• If you enjoyed this month's feature story on MEMS and nanotechnology, you'll want to visit [www.nasatech.com/features](http://www.nasatech.com/features) for more information on this subject. Each month, we include an on-line feature story that picks up where the print feature leaves off. Additional comments from industry leaders, hot links to related companies, and other supporting information not included in the print piece are highlighted in the on-line feature. You can even access archived on-line stories based on feature articles that appeared earlier this year in *NASA Tech Briefs*.

• Don't forget to visit [www.nasatech.com/25letters](http://www.nasatech.com/25letters) and enter our 25th Anniversary Reader Contest. Simply fill out the brief profile and tell us in 200 words or less how *NASA Tech Briefs* has helped you in your business or daily life during the past 25 years. If your letter is selected, we'll publish it in our December commemorative anniversary issue and you'll be eligible for some great prizes.

# There are easier decisions

But not many

from \$4,250\*

## Agilent 33250A

- 80 MHz bandwidth for sine and square waves
- Arb sample rate of 200 MSa/s and memory depth of 64k points
- Creates pulses up to 50 MHz quickly and accurately
- Includes modulation, GPIB, RS-232, and a 3-year warranty

[www.agilent.com/find/waveform](http://www.agilent.com/find/waveform)

U.S. 1-800-452-4844, ext. 7568  
Canada 1-877-894-4414, ext. 7569

There are easier decisions than choosing the Agilent 33250A Function/Arbitrary Waveform Generator, but not many. Not when, at such low cost, you can get an 80 MHz waveform generator that can produce standard waveforms, arbitrary waveforms and pulses. That has sweep, burst, modulation and external clock reference. And comes from Agilent Technologies. Now in one instrument, you have all the flexibility you need to complete your design. Along with an easy-to-use graphical color display/interface and built-in help system. Should you ever require it, you also have the help of another engineer, just by calling our toll-free number. For more information on the Agilent 33250A, you can call for a data sheet, or visit our web site for an interactive overview. With nearly double the performance and the same price as its nearest competitor, it's one decision you shouldn't have to think twice about. **Dreams made real.**

**Agilent Technologies**

# Reader Forum

Reader Forum is dedicated to the thoughts, concerns, questions, and comments of our readers. If you have a comment, a question regarding a technical problem, or an answer to a previously published question, post your letter to Reader Forum on-line at [www.nasatech.com](http://www.nasatech.com), or send to: Editor, NASA Tech Briefs, 317 Madison Ave., New York, NY 10017; Fax: 212-986-7864. Please include your name, company (if applicable), address, and e-mail address or phone number.

The February issue of *NASA Tech Briefs* included a tech brief on page 52 entitled "High-Performance POSS-Modified Polymeric Composites." One of the authors, Joseph Lichtenhan, has been working closely with my company on the development of conformal coatings for use in the electronics industry. The article concludes with the fact that the concept has not been reduced to practice. However, recent tests have been conducted of a POSS-Epoxy reinforced conformal coating applied on electronic controls as a means of protection from streaming moisture environments. The POSS reinforcement of coatings and encapsulants has been proven by these tests to provide a substantial increase in protection of electronic equipment subjected to hostile temperature and moisture environments.

Francis E. Isaman, President  
TechnoMerix  
celind@gte.net

*(Editor's Note: Francis, thanks for your follow-up comments on this technology, which was developed for NASA's Jet Propulsion Laboratory. More information is available at [www.nasatech.com/tsp](http://www.nasatech.com/tsp) under the Materials category.)*

*(Editor's Note: Dennis Tito's recent voyage to the International Space Station, courtesy of the Russian Space Agency, has generated both admiration and ire from our readers, including these comments from Gregory N. Shuey.)*

I was the Air Force Director of Security Engineering at NASA's Johnson Space Center during the *Challenger* shuttle disaster. The sentiment among the Air Force at the time was that NASA's penchant for grandstanding by sending non-astronauts up was a dangerous risk that was not merely a publicity stunt to generate more funding support. The net result was that Christa McAuliffe — the "tourist" — seemed to

get all the public sympathy when there were other just as important people who died that day.

There is a time and place for everything. Putting a tourist on-board when the Space Station is built and valuable manpower is not as necessary would be a more prudent approach. The Russians have an amazingly juvenile mentality when it comes to dealing with the rest of the world. I worked with them following the collapse of the Soviet Union and, at the same time, tried to get America to fund projects, buy into Russian projects and business interests, and buy its engineers and its technology. Few people would listen to me. Now we're seeing the results of America's failure to become inserted into the Russian system.

## Introducing PV-WAVE 7.5

- Accelerated 3D graphics using OpenGL
- 30 new features for data manipulation and rapid prototyping
- Integration of IMSL C Numerical Library V5.0

## PV-WAVE — the WAVE you've been waiting for

is an easy-to-use analysis and visualization environment that enables engineers, scientists, researchers, and business analysts to understand complex datasets and rapidly build visual data analysis applications to solve complex problems.

- A rapid application development environment
- Build robust applications or perform adhoc analysis
- An open system for data analysis and visualization
- An easy to use interface to quickly view your data
- Math and stat functions based on the IMSL Libraries
- Excellent data connectivity features

"Visual Numerics has partnered with us by providing not only the best technology, but also service that is unparalleled in the industry."

Brian Young  
Senior software engineer  
Marquette Medical Systems

Discover what customers worldwide have known for 30 years. PV-WAVE gives your business a complete advantage by increasing productivity, accelerating development and illustrating key knowledge contained in your data.

PV-WAVE: Helping customers solve complex problems.

Read real-life PV-WAVE success stories and find out more about the new version at:

## New Ceramic Coating Improves Gas Turbine Performance

Robert Sherman, EPRI

When attempting to boost gas turbine efficiency, operators have traditionally increased firing temperatures. However, the resulting component wear ultimately leads to a gas turbine's failure. In an effort to prevent this,

EPRI has developed a multi-layered, laminated, nanostructured ceramic coating designed to create a protective barrier against heat, oxidation, and corrosion on gas turbine blades.

The coating is applied by an electron-beam physical vapor deposition process or by sputter coating at temperatures above 1020°C. The coating's thinness reduces stress and weight, and improves the blade's aerodynamic efficiency. The laminated ceramic coating also improves turbine performance by insulating the cooling channels cast into turbine blades and vanes, reducing the requirements for cooling air and the corresponding performance penalty.

## Bayer Develops Superabsorbent Polymers

Günter Sackmann, Bayer AG

Consumer personal care products such as baby diapers and feminine hygiene products are composed of liquid-absorbing materials called superabsorbent polymers (SAPs). Bayer's new SAPs are created through the process of hydrolysis, in which aqueous emulsions of ultra-high molecular weight polyacrylonitrile are converted into poly(acrylic acid) with sodium hydroxide. This process enables the hydrolysis to be controlled closely, producing a wider range of properties.

Through a chemical surface treatment in which they are dried, ground, and sieved to powders, SAPs can be improved even further, resulting in extremely rapid uptake of liquids while producing a "dry" feeling from the liquid-swollen particles. The new SAP powders provide a much greater surface area and have passed toxicological testing for biological side effects, including skin and eye irritation.

## Instrument Landing System Promotes Safer Aircraft Landings in Poor Visibility

Steve Toner, TRW

Landing an aircraft in bad weather has always been challenging for pilots. Instrument landing systems (ILS) have been used to guide pilots in determining the location and size of runways. TRW has developed an ILS that uses a single, fixed, onboard multi-beam antenna system and several low-cost RF beacons on the ground to create an image of the runway as viewed from the aircraft. The antenna system is comprised of a lens, RF processing modules, signal conversion circuitry, and a power supply, all mounted securely in a cylindrical housing in the aircraft.

The ILS requires six ground emitters — four to outline the runway and two more widely spaced apart to provide a more accurate indication of range. The system does not produce a "camera-like" picture, but by using overlapping RF beams, a very accurate image is created of the runway relative to the aircraft. Because this system requires relatively little equipment, its lower cost is ideal for smaller airports. It also enables pilots to fix their position on the ground for taxiing.

## Polymer Blending Technique Reduces Cost and Improves Product

Bill Heise, Eastman Chemical

Dozens of natural and synthetic polymers — such as nylon, cotton, wool, rubber, plastics, and Teflon® — are a part of our daily lives. Polymers are materials consisting of many small molecules, called monomers, linked together to form long chains called macromolecules. Polymeric compounds are materials made from a blend of polymers created in a generally expensive process called impact modification.

Eastman Chemical's new polymer blending technology called Optiloy enables manufacturers to use emulsions in standard PET polymerization reactors to create blends without expensive impact modification. This technology enables a wider range of blends to be created in a polymerization reactor, including condensation-type polymers and a broader category of addition-type polymers that traditionally have been created using extruder blending. Unlike conventional impact polymerization, Optiloy enables the manufacture of a wider range of polymer blends with a simpler manufacturing process, and without large capital outlays for additional equipment, reducing overall cost.

[www.nasatech.com/techsearch/tow/eastman.html](http://www.nasatech.com/techsearch/tow/eastman.html)

# MEMS: Smaller is the Next Big Thing

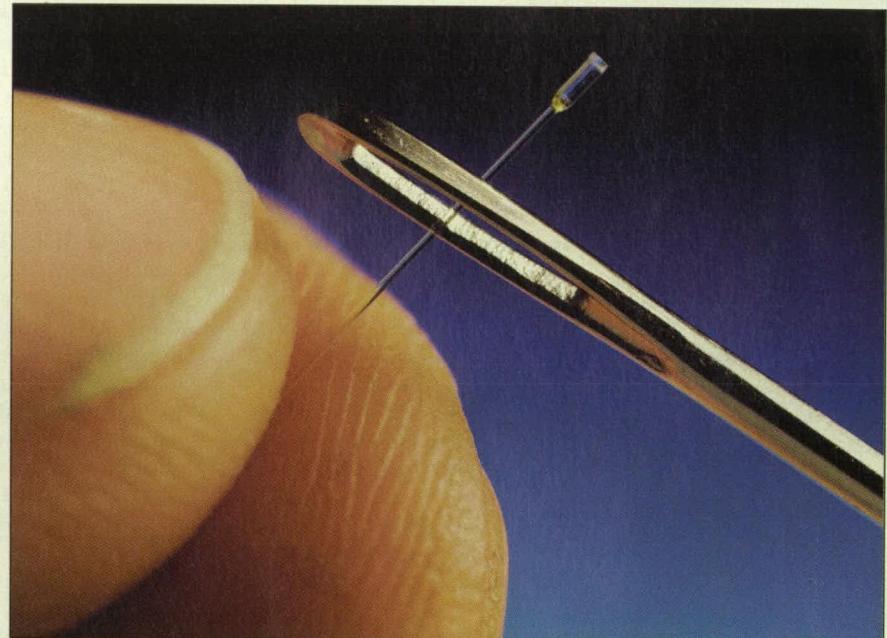

The basic idea has been around since the 1960s — micron-sized devices that measure typically a few millimeters across. But it's been only in the last decade that Microelectromechanical Systems (MEMS) and nanotechnology have become important parts of most areas of science and technology.

MEMS devices are similar in most ways to conventional devices such as sensors and accelerometers, but at a much smaller size. Nanotechnology refers to devices ranging in size from a nanometer to a micron. Made using semiconductor fabrication techniques, micro injection molding, or other more specialized processes, MEMS devices are frequently combined with integrated circuits on a single chip.

The benefits of using MEMS technology are many, including the obvious benefit of size. And while you may think the smaller a device, the higher the cost, think again. Thanks to integrated circuit processing methods, thousands of MEMS can be mass-produced on a single six-inch silicon wafer, making MEMS less expensive to produce than conventional parts.

MEMS also enables new functionality, according to Andrew Swiecki, vice president of sales and marketing for IntellicSense, a subsidiary of Corning that designs, develops, and manufactures MEMS devices, as well as sells MEMS-specific CAD software called IntelliSuite™. "There are many things that can be done with MEMS devices that can't be done with other devices." For example, he added, MEMS devices are very low in mass and are very reliable structures, so they can be used in all-optical switching.

New applications for these miniature wonders are popping up every day. Market research firm Frost & Sullivan estimates that the total MEMS market, now

The FOP-M in-vivo blood pressure transducer from Fiso Technologies (Sainte Foy, Quebec, Canada) is a fiber-optic MEMS sensor located at the tip of a catheter, internal to the body, for high-accuracy measurements even in the presence of EM or RF fields.

at \$1.4 billion, will increase at a compound annual growth rate of 17 percent through the year 2004, when the market is expected to exceed \$3 billion. Automotive applications such as airbag sensors comprise one-third of the total market, while the medical market is the second largest industry using MEMS in products like disposable blood pressure sensors.

Smart munitions that can alter their paths after firing, robotic grippers, metering nozzles for inkjet printers, drug delivery systems, accelerometers used in antilock braking systems, and automotive sensors for measuring fuel level, tire inflation, and oil pressure are just some of the many applications for MEMS. The telecommunications industry has been invaded by the MEMS wave, primarily for reliable optical switches.

According to Tom Connolly, engineering manager of silicon products for Endevco Corp. — a supplier of sensors, accelerometers, and transducers — the medical and automotive fields hold the greatest promise for commercial success of MEMS. "We're getting into the health field in pacemakers," he said. "Basically, we're using an accelerometer to determine the activity level of the person with the pacemaker. The accelerometer can tell the computer inside the pacemaker whether to increase the heart rate or decrease it, depending on how much movement is involved."

Endevco's other big focus is on the military. "During Desert Storm, the military dropped bombs onto bunkers in Iraq, sometimes exploding on the wrong floor of the bunker. We're designing an accelerometer that can penetrate and count

the microsystems advantage

**Tuesday, September 18 – Friday, September 21, 2001**  
**The Ronald Reagan Building and International Trade Center**  
**Washington, D.C.**

MEMS, microsystems and nanotechnologies are devices smaller than a grain of sand that are taking the place of larger, traditional components. They offer advantages in cost, reliability, durability, quality, efficiency, energy requirements, real estate requirements and environmental impact. Take three days to realize the benefits of small tech... Maximize your potential.

**Tuesday, September 18**

Welcome reception and registration

**Wednesday, September 19**

Exhibits open

**Big Applications in Small Tech**

Explore the next five years of small tech solutions and applications.

Keynote: Mr. Jeffrey Hilbert, Coventor

Panelists: Mr. Barry Alexia, John Deere Worldwide

Dr. Albert Pisano, University of California at Berkeley

Mr. Erik Puik, TNO Industries, the Netherlands

Mr. Jim Walker, Tellium, Inc.

**Lunch with Mr. Daniel Burrus, leading technology forecaster**

**2020 Vision**

Presenters focus on the next 20 years of potential small tech applications and their impact.

Keynote: Dr. Kristofer Pister, University of California at Berkeley

Panelists: Dr. Wayne Knox, University of Rochester

Dr. Marc Madou, Nanogen, Inc.

Dr. Al Romig, Sandia National Laboratories

Dr. Clark Nguyen, University of Michigan

**Thursday, September 20**

Exhibits open

**The Public Initiatives**

National organizations address how and why they are using small technologies.

Dr. William Tang, Defense Advanced Research Projects Agency (DARPA)

Dr. Filbert Bartoli, National Science Foundation (NSF)

Dr. Carol Dahl, National Cancer Institute (NCI)

Dr. Michael Gaitan, National Institute of Standards and Technology (NIST)

**Reality Checks**

Open forum for attendee questions and solutions.

Moderator: Mr. John Callaway,

host of WTTW-TV's Chicago Stories

Experts include:

Dr. Roger Howe, University of California at Berkeley

Dr. Marc Waelti, IntelliSense, Corp.

Closing Remarks: Mr. Rick Snyder, Ardesta LLC

**Dinner with Bill Bradley**, former U.S. Senator and presidential candidate.

**Friday, September 21**

**Small Tech Workshops**

**Venture Capital Opportunities**

Moderator: Mr. James Koshland,

Gray Cary Ware Friedenrich, LLP

**Packaging Solutions**

Panelists include:

Mr. Joe Giachino, University of Michigan

Mr. Erik Puik, TNO Industries, the Netherlands

Dr. Marc Waelti, IntelliSense Corp.

BIG NEWS IN SMALL TECH.

the number of stories it goes through in these bunkers, and explode it on a particular floor. It's able to distinguish timber, concrete, and open spaces, and even the angle of impact. It's very exciting stuff."

Exciting stuff, indeed. But for all the gee-whiz attraction of these devices, the MEMS industry has been slow to mature. According to a report from Roger Grace Associates, it's the R&D and university activities that continue to be well-funded and robust, rather than the commercial arena.

Swiecki agrees that MEMS is definitely not a mature market — yet. "It's

continuing to grow very rapidly. IntelliSense has been working in the MEMS area for 10 years, which makes it one of the more experienced companies. We've been able to see the industry change over the years in all areas," Swiecki said. "Ten years ago, MEMS was used extensively in the sensing industries. Today, the big areas for MEMS are in optics and telecommunications, as well as in life sciences."

The MEMS market is rather fragmented, said Connolly. "There are a number of big players, like Analog Devices, who go after the automotive mar-

ket, where they have the big volume. On the other hand, Endevco is a smaller player. We go for niche markets and applications like inertial measurement units for guided missiles. The volumes aren't very high, but we're able to work with specific application requirements," he added.

Connolly sees the MEMS market on the verge of an explosion. "They're talking about it becoming a \$2 billion market. From our little world, we're seeing increased demand as applications open up." As the market expands, explained Connolly, applications are growing in the health and entertainment fields. "As acceptance increases and the costs keep coming down, it really is becoming quite a flood."

## Design Challenges

So when these flood gates open and more MEMS devices pour out into commercial industries, who will make them, and how small will they get? MEMS-based designs can produce systems on a chip, in which a transceiver, batteries, sensors, and microprocessor are all on a single component not much larger than a postage stamp. The trick is designing each miniature piece of the system, and making sure they are manufacturable and durable enough to operate.

MEMS devices are surprisingly rugged and can operate for long periods of time on little power. They must be able to endure damaging internal heat build-up, and withstand excessive structural loads, ambient temperature swings, and severe shock and vibration.

"MEMS is a unique technology, so there will always be unique design challenges," said Swiecki. "For every commercial MEMS device that's developed, both the device itself and the process to make it need to be developed." Another challenge, explained Swiecki, is that MEMS requires a lot of engineering disciplines. In order to create a new MEMS device, he said, a company needs "chemical engineers, process engineers, mechanical engineers, electrical engineers, potentially fluidic engineers — a great deal of diverse expertise."

That expertise includes the ability to simulate and analyze how these devices will perform. Software vendors have even begun to specifically address MEMS development as a capability of their products. ALGOR, a supplier of Finite Element Analysis (FEA)-based simulation software, has incorporated tools for simulating MEMS. The company's solution links electrostatic analysis to structural analysis with a graphical user interface that works

## A 10,000 psi ON/OFF valve in a 3.1" package!

### 'V' Series Valves provide extremely long cycle life/high reliability

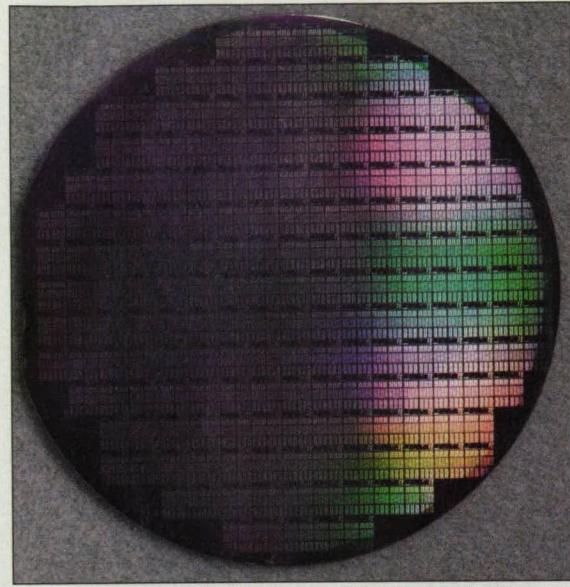

- Piston sensor design ensures high reliability & exceptional cycle life
- Compact package - only 3.1" high
- High flow capacity:  $C_v = .75$  or 2.0
- Gas or liquid applications
- Normally open or normally closed
- Brass or 316 stainless steel machined bar stock
- Low actuation pressure: 30-60 psi
- High operating pressure: 6,000 psi maximum (brass), 10,000 psi maximum (stainless)

Global technical support & distribution • Facilities in the US, Germany and Asia

within many CAD systems, and includes a FEA model-building tool. "ALGOR's MEMS solution will enable engineers to design the devices that promise to make the next generation of electronic products smarter and cheaper," said Michael Busler, ALGOR's president and CEO.

This wafer contains bulk-micromachined microfluidic components made for laboratory analytic equipment. The wafer is shown post-processing, but prior to dicing and packaging. (Photo courtesy of IntelliSense)

Another simulation software vendor, ANSYS, offers the ANSYS MEMS Initiative Web site ([www.ansys.com/action/MEMSinitiative/index.htm](http://www.ansys.com/action/MEMSinitiative/index.htm)) that features MEMS simulation applications using the company's ANSYS/Multiphysics package, technical papers, and a MEMS database.

With all of this engineering expertise, how small can MEMS devices get? Theoretically, said Connolly, there isn't a size limit, but there are practical limitations. "The inertial mass is essentially what gravity or acceleration is acting upon when it comes in contact with an accelerometer. If you're concerned about size, you can always make them smaller. But the larger the mass, the more sensitive the device. On the other hand, we're being pushed to make these things smaller."

Physics is ultimately what will define the smallest size possible, and the capabilities of the materials used,

according to Swiecki. "On a more practical level, the applications will define how small devices need to be for each application."

## Where MEMS is Going

Perhaps the most innovative and exciting applications for MEMS technology are coming not from commercial industry, but from university, government, and independent research labs. NASA has been a leader in the development of MEMS technology for missions requiring lower cost, smaller size, lower weight, and less power consumption. Nanotechnology development has been underway at a number of NASA centers, including The Center for Space Microelectronics Technology's Microdevices Laboratory at NASA's Jet Propulsion Lab in Pasadena, CA. The Center focuses on sensors, microelectronics, environmental and biomedical technologies, and high-performance computing devices that use micro- and nano-sized devices. NASA's Goddard Space Flight Center in Hampton, VA, and Glenn Research Center in Cleveland, OH, also have begun initiatives to develop and com-

## REAL TIME PATTERN RECOGNITION

### IDEAL FOR IMAGE, VOICE AND SIGNAL PROCESSING

- Massively parallel processing
- Recognition time independent of all known patterns
- Learning by example
- Programming-free, Modeling-free
- 200,00+ recognitions/second
- Equivalent to 13.2 billion instructions/second (13.2 GIPS)
- Reconfigurable technology using FPGA on a PCI board

### ZISCBlaster

ZISCBlaster provides, in a single, cost-efficient short PCI board, more processing power than any available DSP configuration for pattern recognition.

ALGOR software was used to calculate the displacement of this MEMS telecom switch due to electrostatic forces. The inset shows the size of the switch compared to a penny.

mercialize microsystems. High-temperature pressure sensors, chemical sensors, bio-MEMS, and silicon-carbide microdevices are under development.

Nanotechnology also is opening doors to new materials such as carbon nanotubes, a new form of carbon that measures a few nanometers in diameter and several microns long. Carbon nanotubes have exceptional mechanical properties. Researchers at NASA's Marshall Space Flight Center in Huntsville, AL, are working on carbon nanotube material that is 100 times stronger than steel. Researchers at IBM in Yorktown Heights, NY, already have fabricated arrays of transistors from carbon nanotubes, paving the way for electronic circuitry smaller and faster than anything silicon could support.

IBM's work is just one example of commercial companies taking advantage of MEMS and nanotechnology. Said Swiecki, "The larger companies with more developed manufacturing systems and a more flexible infrastructure are beginning to take a lead role in applying MEMS technology to commercial products." The future of MEMS, he added, is in the applications. "If you asked me ten years ago where the market would be today, I would have been wrong. We'll see more commercial applications, and we'll see the technology maturing. There is a lot of potential for MEMS technology. We don't always know what will come out of that potential, but we do believe it's one of those enabling technologies that will continue to grow."

A  BLACK & DECKER COMPANY

# Compaq Visual Fortran 6.5

Steven S. Ross

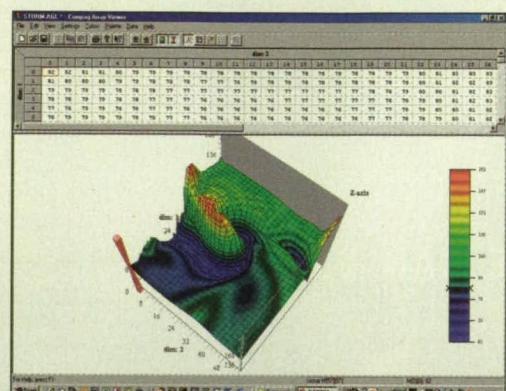

My first computer languages were the IBM 1620 assembly language, followed by Fortran II, then Fortran IV running on an IBM System 360. As late as 1988, I was still writing short programs in Fortran more or less from scratch. But I wasn't liking it. The real break with the tribe came when I had to rebuild a Fortran sparse matrix solver for a 40-million-cell

easier to settle on one or two languages for development. It is not as modular as the newer object-oriented languages. For another, C is continually being upgraded — C+, C++, and now C#. Nevertheless, because Fortran 90 and 95 build on earlier versions and only rarely let any functionality go, and because

most Fortran code is pretty compact, old code is easy to use. The Compaq support forum even had a message from a team using Compaq Visual Fortran to port 350,000 lines of code (with 2,000 routines) to a PC environment. Whew!

Why Visual Fortran in place of your old standard? After all, I still have a decade-old Fortran compiler from Microsoft, and it works. Well, there is a lot of new functionality in the language itself. But most users probably will care more about the visual programming environment. It's pro-

vided by Microsoft and basically is the same one you'd use with Visual J++, MASM, or Visual C++ (the interface for Visual Basic is slightly different, but you can use Basic for the interface and For-

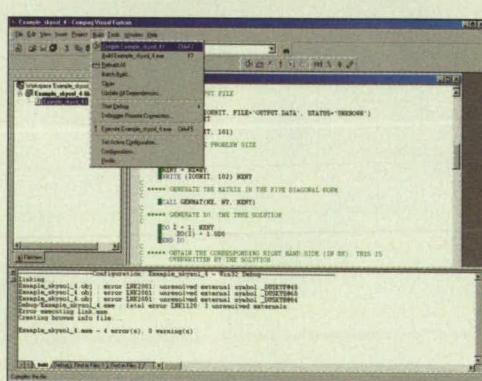

Array visualizer, available in the Professional and Enterprise versions. The graph (of the data in the upper window) can be rotated and repositioned.

data set, to run on a 16-MHz 80386 IBM PS2 Model 80 with a cushy 9 MB of RAM and a Microway co-processor. I had used too many bad programming tricks to port the code easily — not checking array bounds, for instance, so that a lot of stuff got reset to zero without any extra code. I ended up modifying a sparse matrix program written by someone else, in Microsoft Assembler (MASM).

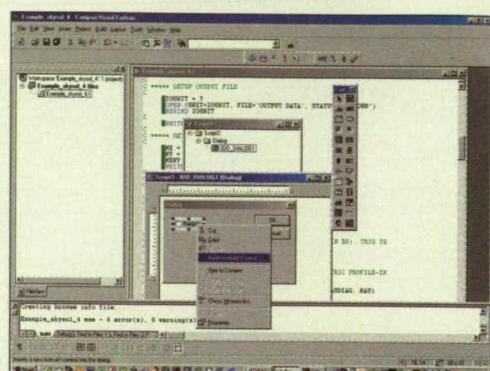

If I had had Compaq Computer Corp.'s Visual Fortran 6.5 ([www.compaq.com/fortran](http://www.compaq.com/fortran)) back then, I might have stuck with my original plan. It handled the little things well — easily checking (with a runtime module) and then compiling and building a bunch of routines from my old Mathlib disks, complete with snazzy new Windows interfaces. And the Professional Edition comes with an array visualizer, so if I had transformed my matrix into something digestibly smaller, I could have viewed the data graphically.

Why would you use Fortran today? You probably wouldn't, unless you had old code to port. It's not that Fortran is obsolete. It's just that organizations find it

Getting ready to run the debugger. The code has some variables that are undefined.

tran for the back end of an application). With Visual Fortran, you also can link code written in C++ or other languages to your Fortran routines, and vice versa. You will have to get used to the idea that the Windows interface typically is much bigger than the back-end code that does the calculations.

Adding a fancy dialog box with lots of interface options.

In the Visual Fortran environment, you specify the type of project you want to start, mainly by defining the interface. For instance, if you specify a project as a full-blown "Windows application," you can build a program that takes full advantage of the full Windows interface, with multiple windows and full graphics. But you'll probably need to know a lot of details about the Win32 API. At the other end of complexity, you can tell the system your project will be a simple command-line "console" application. In between, you can choose to create a "standard graphics" application with one window, or "QuickWin" application (multiple windows, but with basic menus, charts, and icons).

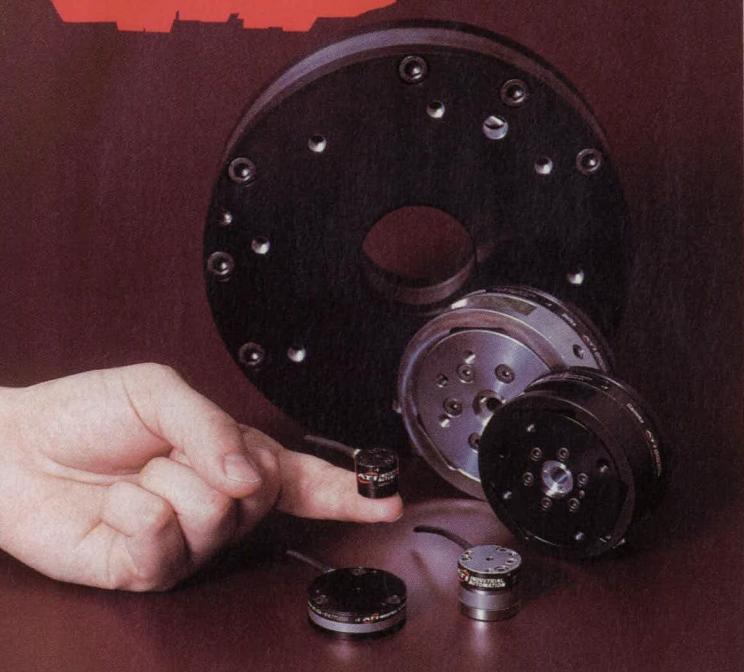

After you write or import the code, you can debug, link, and compile from the same interface. It recognizes and accepts code originally written in Fortran 90 and 77, even when the constructs are obsolete. The Standard edition includes Compaq's math library and an array viewer. The Professional edition adds a wizard to turn programs into COM servers, a sophisticated array visualizer, and the IMSL math and stats libraries. The Enterprise edition adds a toolkit and extensions for server applications.

# Six-axis Force/Torque Sensors

**Strong Transducers With Low-Noise Outputs Measuring Fx, Fy, Fz, Tx, Ty, Tz.**

**NEW PCI, cPCI  
& PCMCIA Interfaces**

Shown are ATI six-axis transducers from 17mm dia. to 330 mm dia.

ATI manufactures a variety of extremely robust six-axis Force/Torque (F/T) sensors that provide low-noise, high-resolution signals with output speeds of up to 10kHz and factors of safety up to 27 times measurement range. Since 1983, ATI has provided thousands of customers with F/T's ranging from the smallest six-axis sensor in the world (17 mm diameter) to sensors measuring thousands of pounds. The F/T can provide data via voltage outputs, RS-232 serial or interface with either ISA, PCI, PCMCIA or cPCI buses. ATI is developing interfaces to Firewire, VXI, USB, DeviceNet and Ethernet. The F/T can also interface with analog data acquisition systems (seven channels required).

## Who's Who at NASA

### Dr. Ayanna Howard, Task Manager, Telerobotics Research and Applications Group, Jet Propulsion Laboratory

Dr. Howard is an information systems engineer who leads the Telerobotics Research and Applications Group at NASA's Jet Propulsion Lab in Pasadena, CA. The team is developing an intelligent software tool for terrain-based analysis of Mars. She also is the principal investigator on a project to develop a real-time software package for autonomous rover navigation on hazardous terrain.

**NASA Tech Briefs:** What are neural networks and how are you using them in your projects?

**Dr. Ayanna Howard:** Neural networks are one of the methods we use to give a robot the ability to learn from an experience. It allows you to associate one type of input with another. For instance, we can program a robot to know that if it encounters a four-legged animal that barks, it's a dog. Or, if the four-legged animal meows, it's a cat. Based on the input, we can give the robot parameters on how to deal with what it encounters.

One of the nice things about artificial intelligence is that the applications may change, but you can use a lot of the same techniques. Neural networks are a type of learning tool, so anything that you can learn, you can apply a neural network to. If you have the infrastructure, you may have to tweak things here and there, but the background is so solid that you don't have to re-engineer the entire process.

**NTB:** You also use a lot of fuzzy logic in your projects. What is fuzzy logic?

**Dr. Howard:** Everything in the real world is not exact — nothing is 100 percent. We, as people, deal with this all the time. If we're walking and the ground is suddenly uneven, we don't fall — we compensate. Yet, if a robot is walking on flat terrain and suddenly there's a hill, it will fall down because it won't know how to deal with it. The example I like to use is babies. A baby will learn how to walk. But if something drastic happens, and say, it loses a toe, the baby will adapt. Humans use approximation. We don't see a cat

and think about the measured physical dimensions of the cat. We say that the cat is big, or small, or fuzzy.

Fuzzy logic takes what humans use — approximation, language, and linguistic-based representation — and applies it in terms of an engineering technology.

**NTB:** Could any of these artificial intelligence techniques be applied for commercial use in the near future?

**Dr. Howard:** Manufacturing would definitely be a field where these types of programs could be used. Japan actually uses a lot of fuzzy logic in their plants, so that's definitely a possibility for further use. In fact, right now you have companies trying to do pallet operations where they want the automated forklift to go into a warehouse, find the pallet it needs, lift it up, and take it out to the truck for shipment. That's the type of thing for which you could use neural networks and fuzzy logic, because it is basically the same problem. It actually would be easier because you would know what the warehouse looks like. It would be easier to apply these techniques to known elements and manmade structures than it is to apply it to an unknown environment like the surface of Mars.

**NTB:** How has the response to this sort of technology changed as it has grown?

**Dr. Howard:** Interest has grown. People now see the validity of this technology, especially if you want to send an intelligent device into a place where you don't want humans to go. Anywhere that human life might be endangered, you can send something powered by artificial intelligence. Underwater robotics is a good example. We like to send probes down to the bottom of the sea. Due to things like severe pressure, you don't want to send people. You'd send a robot with the same characteristics. Only this time, you have a 3D world instead of a flat plane. That's where fuzzy logic comes in. In terms of the neural networks, because we don't know exactly what it looks like down there, we give the robot the ability to adapt to the situation even if our initial data was incorrect.

# Commercialization Opportunities

## Analog VLSI Circuits for Hebbian Learning in Neural Networks

These circuits were designed and built to implement Hebbian synapses with an improved method of modifying and storing synaptic weights for use in neural-network circuits. The circuits are in-

tended for neural networks that operate with spiking input and output signals. (See page 28.)

## Design of a Highly Reliable Controller for an I<sup>2</sup>C Bus

The original design lacks fault-tolerant features that could protect against

bit errors, shorting of output drives, or babbling nodes. The present design adds such features.

(See page 32.)

## Array of Nanoklystrons for Frequency Agility or Redundancy

Multiple, individually selectable klystrons would be contained in a single, compact unit. Each nanoklystron would resemble a conventional klystron but would be many times smaller, with resonant cavities formed by micromachining in silicon.

(See page 36.)

## Millimeter-Wave Dichroic Plates for High Angles of Incidence

A plate of this type is used to separate higher- and lower-frequency components of incident electromagnetic radiation linearly polarized along a specified axis. The plate is designed to reflect most of the radiation below its cutoff frequency while allowing radiation at higher frequency to pass through.

(See page 40.)

## Making Ion-Accelerator Grids From Ti Instead of Mo

Titanium offers several advantages over molybdenum as material for thrusters for spacecraft. These advantages could also be expected to extend to the manufacture of grids for ion accelerators used in scientific research and fabrication of semiconductors.

(See page 45.)

## Quasi-Fractal Lenticular Booms

According to the proposal, the traditional design would be replaced by an improved one to resist buckling more strongly.

(See page 46.)

## Numerical Index for Quantifying Aircraft Icing Hazards

Hazard severity and meteorology are related by measuring ice accumulation rates observed on a standard airfoil under prescribed conditions. This system has greater fidelity than existing ones and is applicable to all types of air vehicles.

(See page 51.)

## Special Coverage: Computers & Peripherals

### The NASA Spacecraft Transponding Modem

NASA's Jet Propulsion Laboratory, Pasadena, California

A report describes the NASA Spacecraft Transponding Modem (STM) — a space-craft transponder now under development for planned use on deep-space missions scheduled for launch in the year 2003. In comparison with a traditional deep-space transponder, the STM will be smaller and less power hungry; the reductions in size and power demand will be effected by use of custom application-specific integrated circuits. The STM will perform all of the traditional deep-space-transponder functions, plus some coding, decoding, and time-tagging functions: The STM will track an X-band uplink signal and transmit both X- and Ka-band downlinks. A command detector, a code-block processor, and hardware command decoder will be integral parts of the STM.

Coding functions will include Reed-Solomon coding, convolutional coding, and turbo coding for downlink telemetry. Downlink symbol rates could be ramped linearly to match the expected gain/noise temperature of a receiving station. Data could be transmitted by any of three different phase-modulation schemes at rates from 5 b/s to 24 Mb/s. Other functions will include standard turnaround ranging, regenerative pseudonoise ranging, and differential one-way ranging.

### Analog VLSI Circuits for Hebbian Learning in Neural Networks

An unconventional design extends synaptic-weight-storage time and enforces Hebbian learning.

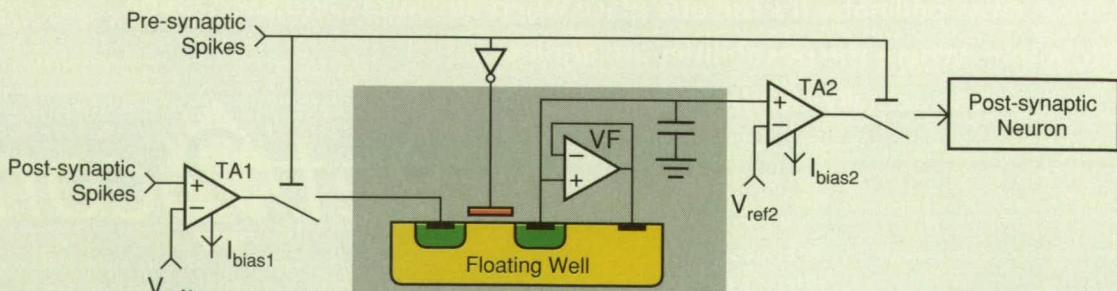

NASA's Jet Propulsion Laboratory, Pasadena, California

An analog very-large-scale integrated (VLSI) circuit was designed and built to implement Hebbian synapses with an improved method of modifying and storing the synaptic weights, for use in neural-network circuits. (In Hebbian synapses, the synaptic weights are modified through Hebbian learning, which is a local unsupervised adjustment of the weight depending on the correlation of activity between pre-

and post-synaptic neurons.) These circuits are intended, more specifically, for use with neural networks of the type that operate with spiking (as distinguished from steady) input and output signals.

The development of these circuits was prompted by a need to store and adjust on-chip synaptic weights using local Hebbian learning rules. The synaptic weights must be stored in the form of analog volt-

ages (charges on capacitive nodes). Such storage is problematic because the charges tend to decay by leakage through reverse-biased active/well/substrate junctions. The designs of the present circuits reduce the leakage currents to about one-sixth of those conventional synaptic-weight-storage circuits, thereby making it possible to store the synaptic weights for correspondingly longer times.

A Hebbian Synapse for spiking neurons is illustrated.

# These won't save you time or money ...

$$\nabla \times H = J + \epsilon \frac{\partial E}{\partial t}$$

$$\nabla \times E = -\mu \frac{\partial H}{\partial t}$$

$$\nabla \cdot E = \frac{\rho}{\epsilon}$$

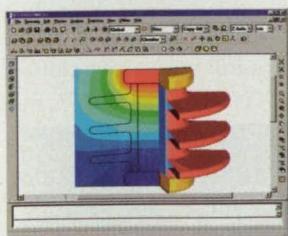

$$\nabla \cdot H = 0$$

## THESE WILL

A CAE electromagnetic package that immediately boosts productivity and saves prototyping costs is hard to find. That's where our line of innovative boundary element method (BEM) simulation software can help.

We've designed each of our packages around three basic principles: **advanced technology, productivity and outstanding customer service.**

A clean, intuitive, user interface means the software is easier to use and learn than most other electromagnetic CAE tools.

### Advanced Technology

We use Integrated's software to model precision magnetic circuits for the reprographics industry as well as other electromagnetic applications. The software enables us to create extremely accurate virtual results. This has allowed us to greatly reduce our prototype-to-production phase."

Group Arnold  
Magnetic Technologies Corp.,  
Rochester, NY.

Advanced features like our intuitive user interface, extensive materials library, powerful solvers, exportable data and graphics, flexible post processing options and powerful parametric optimization routines give you the most sophisticated programs available anywhere. In addition, our coupled electromagnetic/mechanical suite gives you complete solutions.

### Productivity

"Integrated's software offers Industrial Coils the ability to model our designs quickly and accurately. Our design time has been reduced from three weeks down to two and a half days.

**Mike Potter**  
Assistant Engineering Manager,  
Industrial Coils,  
Baraboo, WI.

You'll be producing useful designs in a matter of hours! We provide you with sample sessions to work through, on-line help, web support and full technical and application support to help you solve your toughest design issues. You also get industry standard links that connect you to your favorite CAD program for easy file import/export, shortening your design process even further.

In just minutes, install your program on your desktop PC. Within one day begin working on,

and solving your own designs. In just one week, solve even the most challenging and sophisticated 3D designs.

### Ease and Accuracy

"We are using Amperes to model the recording process for both the writing and reading of high density data storage apps. We are very impressed with the user friendliness and accuracy of the program."

**Dr. Sakhrit Khizroev**  
**Dr. Dimitri Litvinov**  
Seagate Technologies  
Pittsburgh, PA.

**INTEGRATED**  
ENGINEERING SOFTWARE

E-mail: [Info@integrated.ca](mailto:Info@integrated.ca)  
Web: [www.integratedsoft.com](http://www.integratedsoft.com)

A circuit of the present type includes an analog-weight-storage subcircuit (as depicted within the gray box in the figure) in which the transistor that passes charge on to the capacitive charge-storage node resides in a floating well. The floating well is driven by a voltage follower (VF in the figure) from the storage node, thereby shielding the storage node by reducing the leakage current to the well and enabling the node to hold the charge longer than an ordinary switched capacitor could. The voltage across the active/well junction is held to within the offset of the follower; this typically results in a substantial decrease in leakage current from a normal well that is held at the supply voltage of the well transistor.

The charge-storage subcircuit is incorporated within a larger circuit that acts as a Hebbian synapse; that is, it takes pre- and post-synaptic spike signals as inputs, and increases the synaptic weight if the spikes occur simultaneously. The Hebbian-synapse circuit (see figure) contains two additional transconductance amplifiers (TAs): TA1 controls the learning rate by adjusting the current injected into the storage node, and TA2 converts the stored analog voltage value to a current value. The output of amplifier TA2 is gated by the pre-synaptic input spikes, and hence the final output consists of current pulses that are proportional to the stored voltage and injected into a post-synaptic neuron whenever the pre-synaptic neuron fires a

spike. These output current pulses can be summed and integrated with the currents from other synapses in parallel and used to drive the spiking of the post-synaptic neuron. Hebbian learning is achieved by gating charge onto or off the storage node when the pre- and post-synaptic spikes are simultaneous or non-simultaneous, respectively.

*This work was done by Christopher Assad and David Kewley of Caltech for NASA's Jet Propulsion Laboratory. For further information, access the Technical Support Package (TSP) free on-line at [www.nasatech.com](http://www.nasatech.com) under the Electronic Components and Systems category.*

NPO-20965

## Compact, Rugged Enclosure for PC-Based Electronic Circuits

The enclosure helps to protect PC boards against vibrations.

Lyndon B. Johnson Space Center, Houston, Texas

Figure 1 depicts a compact enclosure enabling the operation of personal-computer (PC)-based electronic circuits in harsh environments. The electronic circuits in question are commercial off-the-shelf Industry Standard Architecture (ISA) and Extended Industry Standard Architecture (EISA) printed-circuit boards. The enclosure provides elec-

rical connections and mechanical shielding of the boards. The enclosure serves as a shield against radiated electromagnetic interference (EMI) between the enclosed boards and any exterior equipment. The enclosure also provides mechanical restraint (with some compression) to enable the boards to withstand shock and vibration.

The enclosure consists of two main parts: the housing and the housing cover. The housing includes a baseplate isolator, lower support, lower guide insulator, power supply with EMI filter, passive back plane for the circuit cards (not shown), and connector bracket. The housing cover includes an upper support and an upper guide insulator.

The PC boards are installed in the back plane. The lower guide insulator lower support, and isolator provide support to those parts of the cards that extend beyond bus connectors. The isolator serves as a standoff as

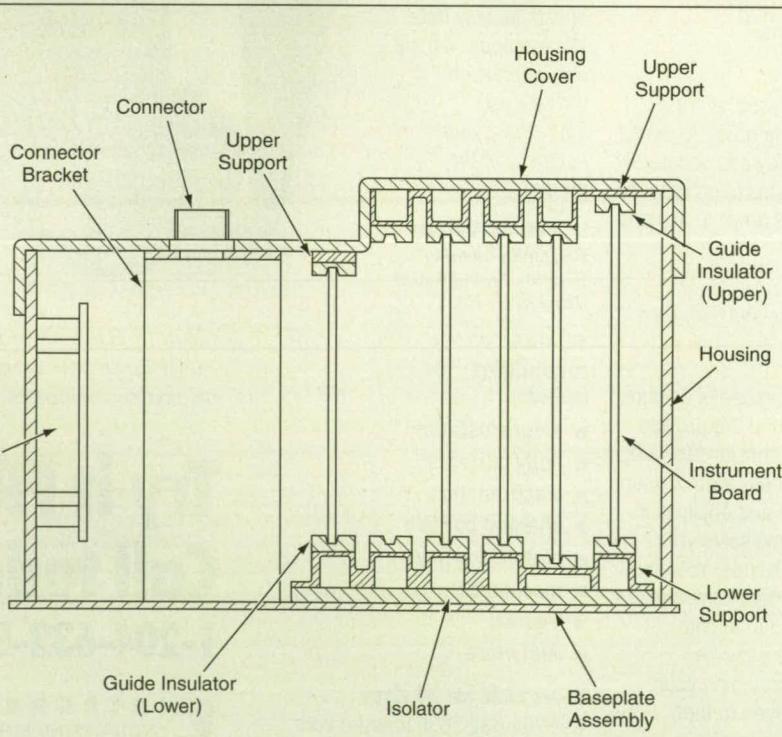

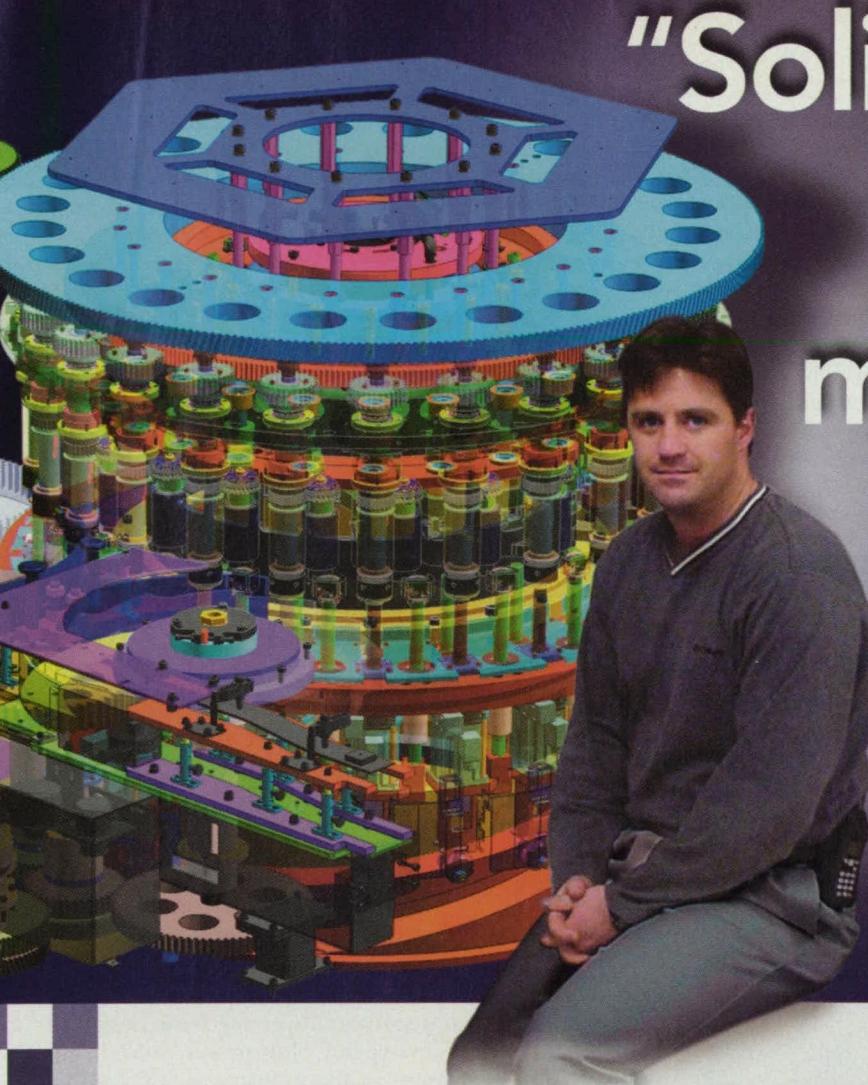

Figure 1. A Compact, Rugged Computer Enclosure is built to protect a PC in a harsh environment.

Figure 2. This Enclosure was designed for a voice-command-system experiment on the space shuttle. The design is readily adaptable to other (e.g., industrial) applications.

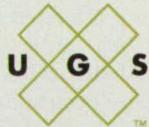

# "Solid Edge gives us *everything* we need for machinery design."

– Paul Choate  
Engineering Manager  
Alcoa Packaging Machinery

Solid Edge is a complete tool kit for machinery design – powerful solid modeling, industrial-strength assembly design, engineering aids, and drafting – all in a remarkably affordable and easy-to-use package. Solid Edge is the most productive CAD package for machinery design, with the lowest cost of ownership, delivering the highest return on investment.

Alcoa Packaging Machinery is using Solid Edge to design innovative machinery for beverage packaging. "We chose Solid Edge because it was the easiest to use," says Paul Choate, engineering manager. "Solid Edge gives us all the tools we require, at a fraction of the cost of high-end systems."

Solid Edge is helping machinery designers realize the business benefits of 3D design – shorter design cycle times, improved product quality, fewer errors, and lower costs. To get down to the business of machinery design with Solid Edge, call 1 800-807-2200 or visit [www.solid-edge.com](http://www.solid-edge.com).

powering  
collaborative  
commerce  
formerly Unigraphics Solutions

## SOLID EDGE

well as a vibration damper. The upper guide insulator and support acts in conjunction with the lower support, lower guide insulator, and back plane to slightly compress the cards. The lower and upper supports are designed and fabricated to match the heights of the cards: This approach enables the enclosure to accommodate cards of different sizes; it also minimizes the size of the enclosure by making it only large enough to house the tallest card.

The connectors provide electrical connectivity among the enclosed boards, the power supply, and external equipment. DC power, microphone signals, and computer communications and other discrete signals flow through the connectors. Vent holes on the housing make it possible to cool the enclosed boards by use of a fan. The vent holes are small enough not to appreciably degrade shielding against electromagnetic interference.

Figure 2 shows a photograph of the prototype version of the flight unit that is

part of the voice command system. The unit successfully flew on STS-78. The enclosure with boards passed environmental tests including vibration to 6.1 g(rms).

*This work was done by George Salazar and Dena Haynes of Johnson Space Center and Marc Sommers, Hector De Leon, and Eric Kuehnle of Lockheed-Martin. ## Design of a Highly Reliable Controller for an I<sup>2</sup>C Bus

Fault-tolerant features have been added to the basic I<sup>2</sup>C design.

*NASA's Jet Propulsion Laboratory, Pasadena, California*

The design of a highly reliable controller for a digital data bus incorporates improvements, in both hardware and software, over the basic design of a low-speed, low-power, serial bus known in the industry as "I<sup>2</sup>C." ("I<sup>2</sup>C" signifies "inter integrated circuit bus" — a bus developed by Philips Semiconductors in the early 1980s.) The original design of the I<sup>2</sup>C bus lacks fault-tolerant features that could protect against bit errors, shorting of output drives, or babbling nodes (nodes that misbehave or disrupt normal communication). The present design adds such features: It augments the standard I<sup>2</sup>C bus protocol with low-overhead error-detection features and a fail-silent messaging system, and it adds hardware features that automatically isolate babbling nodes. These fault-tolerant features can be disabled through software (for example, to aid testing), but the design makes it difficult to do this accidentally.

The principal advantages of the present design over prior I<sup>2</sup>C-bus designs are the following:

- Cyclic redundancy checking (CRC) is used to obtain partial immunity to errors in messages on the bus.
- Devices on the bus are inhibited from monopolizing the bus, even when hardware or software faults occur.
- Special commands have been added to enable direct control of one node by another.

- Asynchronous logic in the basic design has been replaced with synchronous logic.

In addition, the bus is compatible with devices that have been designed to function on previously designed, standard versions of the I<sup>2</sup>C bus.

The overall function of a controller according to the present design is that of an interface between a peripheral component interface (PCI) bus and an I<sup>2</sup>C bus. The design calls for some basic I<sup>2</sup>C bus-controller components and associated logic circuitry for a (PCI) port, plus application-specific integrated circuits (ASICs) that implement logic functions to manage the flow of messages and to exert digital input/output (DIO) control. Additional logic circuits are used as watchdog timers and to effect CRC. On each DIO ASIC, there are two I<sup>2</sup>C bus controllers that drive separate system and subsystem busses. Within each I<sup>2</sup>C bus controller, there are two I<sup>2</sup>C commercial-off-the-shelf I<sup>2</sup>C cores. A transmitting line and a clock line between the

cores are ANDed together to make them share a common clock and a data-transmission driver with a separate mixed-signal ASIC.

# Electronic Components and Systems

## Full-Spectrum Arraying of Receiving Radio Antennas

Detectability is increased and both Doppler and ranging data can be extracted.

NASA's Jet Propulsion Laboratory, Pasadena, California

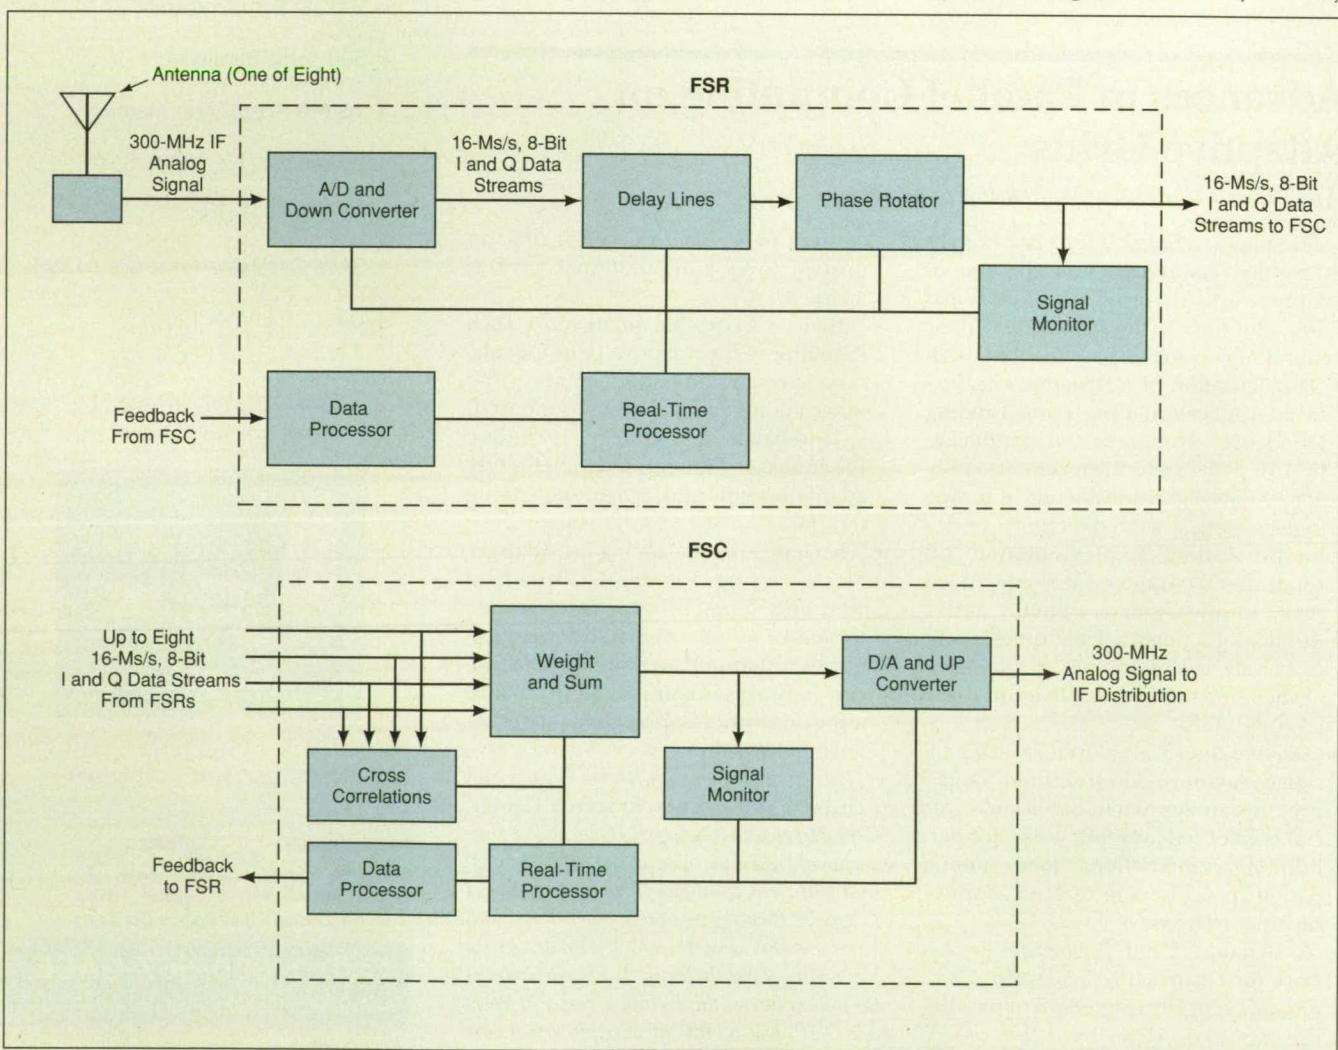

A method of arraying of receiving radio antennas involves utilization of all of the signal information available across a broad spectral band that includes any signal(s) of interest. As used here, "arraying" signifies combining the signals received by multiple antennas at different locations in such a way as to improve reception, as though one had a single larger antenna. Going beyond synthesis of a larger antenna, the present method also provides for extraction of Doppler frequency shifts and differential delays of signals, thereby enabling the generation of information on the ranges and veloci-

ties of signal sources. The method was devised to enhance spacecraft-tracking and -telemetry operations in NASA's Deep Space Network (DSN); the method could also be useful in such other applications as radio astronomy, commercial satellite communications, and radio (including television) broadcasting.

In this method, the signals from the multiple antennas in an array are combined in real time by use of correlation processing, among other techniques, implemented by a combination of analog and digital electronic hardware and software. The signal received at each an-

tenna is characterized by a delay and a Doppler shift that depend on the relative position and motion of the antenna and the spacecraft or other signal source. In order to achieve full-spectrum arraying, it is necessary to alter the signal received by each antenna to make its delay and Doppler shift equal to the delays and Doppler shifts of the similarly altered signals received by the other antennas. The altered signals are then combined coherently to obtain an improved detection of telemetry and navigation data.

In the original DSN application (see figure), the signals received by as many

In This Implementation of Full-Spectrum Combining, as many as eight signals in a 16-MHz-wide IF band centered at 300 MHz are processed by digital and analog means to generate an enhanced IF signal, allowing for improvement of telemetry and navigation data.

Let's see,  
should you buy two  
of theirs or just  
one of ours?

Instead of buying separate instruments for sourcing and measuring, get it all in one compact, cost-effective unit—a Keithley Series 2400 SourceMeter®. Each one combines a programmable power source with a highly repeatable, 5½ digit DMM in one handy, integrated unit. Which means you can use it as a V-Source, I-Source, V-Meter, I-Meter—even an ohmmeter. Just set it up, and you're ready for almost any DC measurement you can think of. You can even link any SourceMeter

to popular component handlers for binning and sorting. And they're fully compatible with Keithley's highly acclaimed switching cards and systems for fast, accurate handling of multi-point test applications. Increasing throughput, yield and productivity has never been simpler. Getting all the specs is easy, too. Just download your FREE SourceMeter Kit at the URL below, or call us today at 1-888-534-8453. We'll be glad to answer all of your questions.

as eight geographically diverse antennas are processed by full-spectrum receivers (FSRs) followed by a full-spectrum combiner (FSC). The analog signal from each antenna is first down-converted to an intermediate-frequency (IF) band centered at 300 MHz. Then in an FSR, the IF signal is subjected to a combination of analog-to-digital (A/D) conversion and frequency down-conversion that yields an in-phase (I) and a quadrature-phase (Q) data stream, each consisting of 8-bit samples at a rate of 16 megasamples per second. The delay and phase of the I and Q streams from each

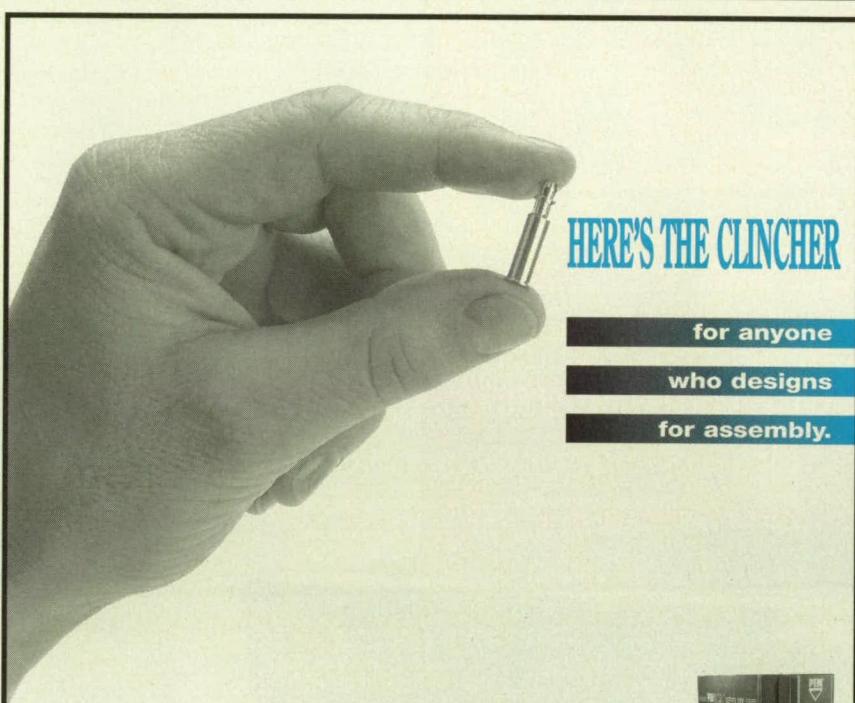

antenna are altered by use of a delay line and a phase rotator. Adjustment is made first by using delay prediction, followed by a feedback measurement of residual delay and phase by the FSC.

In the FSC, cross-correlations of upper and lower sidebands from different antennas (e.g., of the upper sideband received by antenna 1 with the upper sideband received by antenna 2) are computed. The correlations contain information on frequency-dependent and frequency-independent phase offsets related in known ways to differential delays and Doppler shifts. The correlations are

processed to generate phase and a delay offset for feedback to each FSR. The I and Q data streams from the FSRs are weighted and summed; the sum signal is then subjected to digital-to-analog (D/A) conversion and frequency up-conversion to obtain the desired enhanced IF signal.

### Less is more.

Less parts, less assembly steps, less assembly time – all yield more productivity and more cost reductions. To achieve this, designing for assembly (DFA) is critical.

PEM® products are made for DFA. Just punch or drill a hole and press a PEM fastener into place. PEM self-clinching fasteners install permanently into thin sheets. There are fewer parts and fewer total pieces to handle during assembly which translates into cost savings. We also offer threadless and multi-function fasteners to further meet your DFA needs.

These include SNAP-TOP® (shown in photo above) standoffs which eliminate the need for screws, locating pins for quick alignment of mating parts, P.C. board fasteners and many others.

For automated installation, our line of PEMSERTER® presses quickly install PEM fasteners, further reducing assembly time.

## Array of Nanoklystrons for Frequency Agility or Redundancy

Multiple, individually selectable klystrons would be contained in a single, compact unit.

*NASA's Jet Propulsion Laboratory, Pasadena, California*

An array of monolithically fabricated nanoklystrons has been proposed as a frequency-agile and/or redundant source of electromagnetic radiation at frequencies ranging from about 0.3 to about 3 THz. Each nanoklystron would, as its name suggests, be a very small klystron. Like other klystrons, a nanoklystron would operate at a frequency determined primarily by the dimensions of its resonant cavity and the spacing of its electron-bunching grids, with some dependence on applied voltages. An individual nanoklystron could be fabricated in top and bottom halves from silicon wafers and would contain an integral output waveguide and feed horn (see Figure 1). In typical operation, a nanoklystron without a mechanical tuner would generate power only at a fixed frequency. Thus, frequency agility and/or redundancy could be obtained by incorporating into the array multiple nanoklystrons that are pre-tuned to generate signals at all required frequencies.

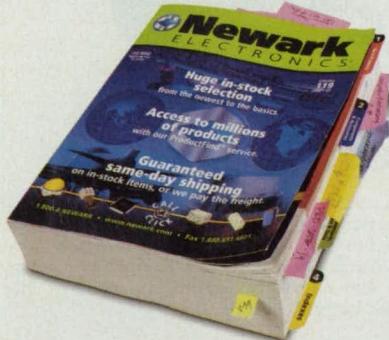

The array of nanoklystrons would be fabricated in substantially the same manner as that of a single nanoklystron, except that the nanoklystrons would be spaced at angular intervals near the periphery of the wafer. The output port of

each nanoklystron would then be oriented along the edge of the wafer (see Figure 2). Each nanoklystron would be fabricated to oscillate at a different predetermined frequency within the desired output band. A particular frequency would be selected by indexing the wafer.

The dimensions of silicon wafers [the present industry standard diameter is 8 in. ( $\approx 20$  cm)] and the horn dimensions required for operation in the intended submillimeter wavelength range are compatible with making thousands of nanoklystrons on a single wafer in a single production run. Contact pads for supplying power to individual klystrons could be formed on the top and bottom of the disk, and registration notches could be

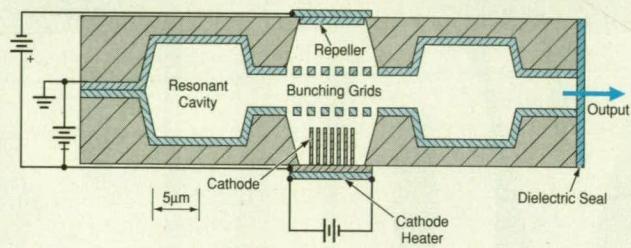

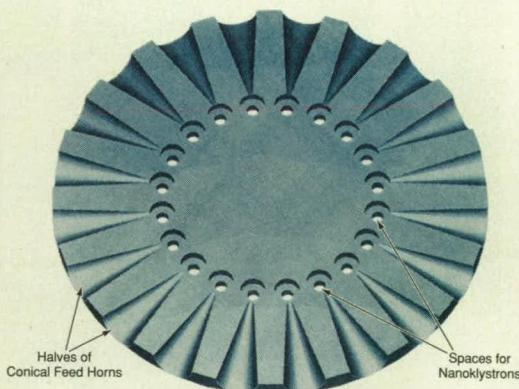

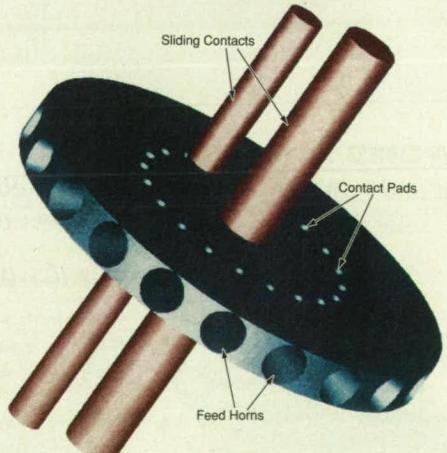

Figure 1. A Nanoklystron would resemble a conventional klystron but would be many times smaller, with resonant cavities formed by micromachining in silicon.

INDEXABLE ARRAY WITH SLIDING CONTACTS TO ENERGIZE THE DESIRED NANOKLYSTRON

Figure 2. An Array of Nanoklystrons with integral output waveguides and feed horns would be fabricated in top and bottom halves of a disk made from silicon wafers. A desired nanoklystron would be selected by rotating the disk to register the top and bottom power contact pads of that nanoklystron with fixed top and bottom contacts.

formed at corresponding angular locations on the top or bottom of the disk; this would make it possible to simply rotate the disk to a detent at a designated angular position in order to obtain radiation at the frequency of the nanoklystron at that position. The contacts and detents would be arranged so that the feed horn of the selected nanoklystron would be in the proper position for output coupling.

## Log-Ratio Circuit With Enhanced Temperature Stability

**Effects of changes in temperature would be canceled at the output.**

*Lyndon B. Johnson Space Center, Houston, Texas*

The figure illustrates a proposed analog amplifier circuit that would put out a voltage proportional to the logarithm of the ratio between two input signal currents,  $I_1$  and  $I_2$ . In comparison with prior log-ratio amplifiers, this one would be relatively insensitive to variations of temperature over a wide range. An additional advantage of the proposed circuit is that the base of the logarithms could be varied.

In this circuit, as in other log-ratio amplifier circuits, the log function would

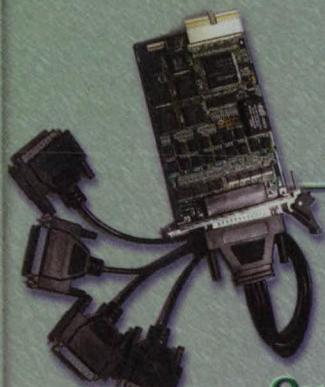

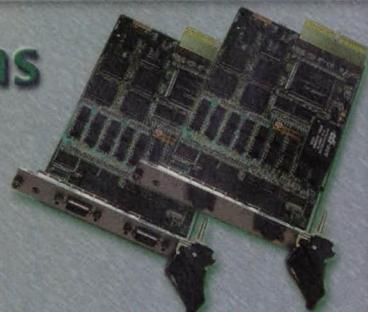

be provided by transistors, the inputs and outputs of which are related in a highly temperature-dependent manner. In designing prior log-ratio amplifiers, attempts have been made to suppress the effects of temperature dependence by use of (a) thermostatically controlled heaters to maintain the transistors at constant temperatures or (b) adjusting the outputs by use of feedback from thermistors in close contact with the transistors. These attempts at tempera-

ture stabilization are subject to several limitations, one being that they are ineffective outside the temperature range of about 0 to 70 °C.

Unlike in prior log-ratio amplifier circuits, no attempt would be made to control temperature or compensate for changes in temperature in the proposed circuit. The proposed circuit would include two matched conventional log-ratio amplifiers, both mounted on the same die so that they could be assured of

## Electronics

This Log-Ratio Circuit would eliminate the effect of the temperature dependence in the outputs of the log-ratio amplifiers. It would also provide a convenient way to adjust the base of the logarithms.

being at the same temperature. The input signal currents would be fed to one of the log-ratio amplifiers, which would respond by putting out a voltage  $(CkT/q)\ln(I_1/I_2)$ , where  $C$  is a constant that depends on the design,  $k$  is Boltzmann's constant,  $T$  is the absolute temperature, and  $q$  is the fundamental unit of electric charge.

Known control currents  $I_3$  and  $I_4$  would be fed as inputs to the other log-ratio amplifier, which would respond by putting out a voltage  $(CkT/q)\ln(I_3/I_4)$ . The outputs of the log-ratio amplifiers would be fed to a divider circuit: the temperature and the other equal terms in the numerator and denomi-

nator would cancel each other in the division, so that the output of the divider circuit would be proportional to  $\ln(I_1/I_2)/\ln(I_3/I_4)$ , which is the same as  $\log(I_1/I_2)$  to the base  $I_3/I_4$ . Thus the base of the logarithms could be selected by setting the control currents to obtain the desired value of  $I_3/I_4$ .

MSC-22413

## Millimeter-Wave Dichroic Plates for High Angles of Incidence

These plates can be fabricated by numerically controlled milling.

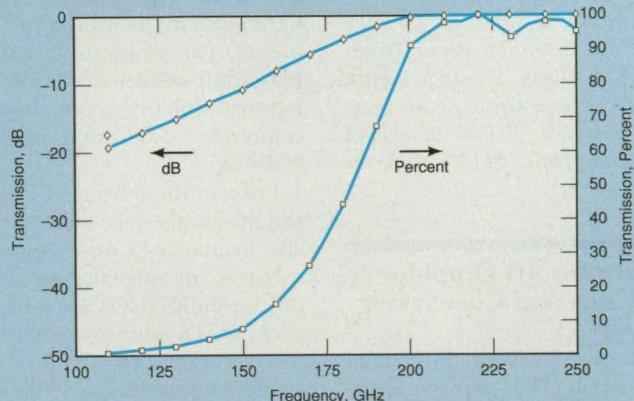

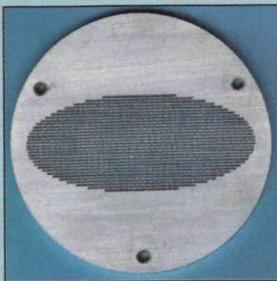

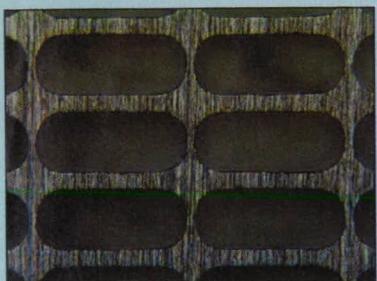

NASA's Jet Propulsion Laboratory, Pasadena, California

Dichroic plates for cutoff wavelengths down to about a millimeter and high angles of incidence can be fabricated by numerically controlled milling of rectangular arrays of waveguide slots in half-wavelength-thick metal plates. A plate of this type is used to separate higher- and lower-frequency components of incident electromagnetic radiation linearly polarized along a specified axis; the plate is designed to reflect most of the incident electromagnetic radiation at frequencies below its cutoff frequency while allowing most of the radiation at higher frequencies to pass through.

Thick metal plates containing regular arrays of holes have been used before as dichroic reflectors. In the case of a plate containing circular holes in a rectangular or a triangular array, performance deteriorates substantially (sharpness of cutoff decreases and insertion loss in-

creases) as the angle of incidence increases beyond 20°. Experience at submillimeter wavelengths has shown that the loss of performance at increasing angle of incidence can be mitigated by use of rectangular holes or slots instead of circular holes.

It is not practical to make arrays of precisely rectangular slots at the plate thicknesses needed for wavelengths in the millimeter range because (1) the preferred fabrication technique in this thickness range is numerically controlled milling and (2) the diameters of the end mills that must be used in this size range are such that the corner or end radii of the slots cannot be much less than the thicknesses of the plates. However, slots with rounded ends or corners can be used, as long as the effects of rounding are taken into account in design computations and acceptable frequency responses can still

This **Dichroic Plate** was designed to reflect at a frequency of 118 GHz and transmit at a frequency of 240 GHz at an angle of incidence of 40°. The slots, each 0.036 in. (0.91 mm) long and 0.0145 in. (0.37 mm) wide, were end-milled in a 0.030-in. (0.76-mm)-thick plate at length-axis intervals of 0.038 in. (0.97 mm) and width-axis intervals of 0.185 in. (4.7 mm). The area containing the slots is an ellipse with axes of 2.78 and 1.18 in. (70.6 and 30.0 mm).

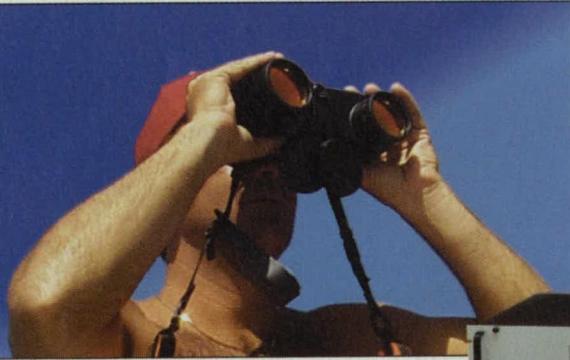

be obtained; this is the basis of the present development.

The frequency response of a dichroic plate containing a rectangular array of slots depends on the thickness of the plate and the shape and spacing of the slots. Typically, for a half-wavelength-thick dichroic plate, the half-power transmission frequency is close to the nominal cutoff frequency of the dominant waveguide mode. For a rectangular slot with sharp corners regarded as a waveguide, the cutoff frequency for the dominant mode is well known and is simply the frequency for which the width of the slot is a half wavelength. For a slot with semicircular ends and an aspect ratio (length ÷ width) of 2.5, the cutoff frequency is about 8.5 percent higher. The figure depicts a dichroic plate containing slots of this shape, along with its frequency response.

*This work was done by Peter Siegel and Hamid Javadi of Caltech for NASA's Jet Propulsion Laboratory. For further information, access the Technical Support Package (TSP) free on-line at [www.nasatech.com](http://www.nasatech.com) under the Electronic Components and Systems category.*

## ■ Computing Diffusion in High-Temperature Coating Layer

COSIM is a computer program that numerically simulates oxidation and diffusion in a metallic coating layer on substrates made of nickel-base alloys. COSIM is primarily useful for analyzing the gradual deterioration and predicting the lifetimes of the protective coating on turbine blades and vanes. At typical high operating temperatures, such deterioration involves oxidation and interdiffusion characterized by times of the order of tens to thousands of hours.

COSIM implements a finite-difference mathematical model to simulate (1) the diffusion of chemical species within the coating including the solute needed to support the growth of a protective oxide scale, (2) diffusion between the coating and the substrate, and (3) oxidation. The program predicts concentration profiles for up to three elements in the coating and substrate after various oxidation exposures. Ternary cross terms and concentration-dependent diffusion coefficients are taken into account. Recession of the surface because of loss of solute is also predicted.

The program incorporates a previously developed mathematical model of growth and spalling of oxide, for use in simulation of either isothermal or cyclic oxidation exposures. The oxide-spalling submodel accounts for consumption of solute at higher rates in cases of cyclic oxidation accompanied by total or partial loss of the oxide scale. The program can predict the life of the coating layer(s) on the basis of a concentration-dependent or other failure criterion (e.g., the concentration of the solute at the surface falls to 2 percent). Hence, the program facilitates parametric studies for evaluation of tradeoffs among coating and substrate parameters (e.g., coating thickness, solute concentration) to obtain the same coating life or for identifying parameters that exert the greatest effect on coating life.

Written in an extension of FORTRAN 77, COSIM contains numerous subroutines that render it easily modifiable for application to different coating-oxidation problems.

## ■ Software for 3D Graphics With Time- and Cost-Saving Features

Enigma version 4.4 is an integrated three-dimensional (3D)-graphics application program that includes multiple cost- and time-saving features. Enigma provides capabilities for building geometric models, key-frame animation, and video recording, and provides graphical front ends for use by simulation application programs. Enigma can add textual and graphical overlays and can incorporate such visual effects as fades and dissolves — features unavailable in many other 3D-animation software packages. What is most remarkable about Enigma is that additional expensive editing hardware is not necessary for taking advantage of all of these features.

Cost and time savings have already accrued at Johnson Space Center, where major simulation application programs are being ported to Enigma, and at other NASA centers, at the facilities of U.S. government contractors, and at the Canadian Space Agency. There is no doubt that Enigma can prove useful to other government agencies and to private industries. Within months of its introduction in April 1995, Enigma was already in use at approximately 100 sites. Although several commercial products could offer competition to Enigma, none offers the full capabilities inherent in Enigma — especially in terms of rendering speeds and flexibility.

Enigma was originally developed for the U.S. space program. It was needed because several Space Shuttle and Space Station engineering and mission operations activities have related but divergent 3D-visualization require-

ments. The space program has unique software requirements pertaining to (1) generating 3D solid models for various uses, (2) defining the hierarchical relationships between models and other elements (e.g., cameras and light sources) common to 3D environments, (3) generating graphical displays that reflect the outputs of simulations, and (4) producing animation sequences for documentation and training.

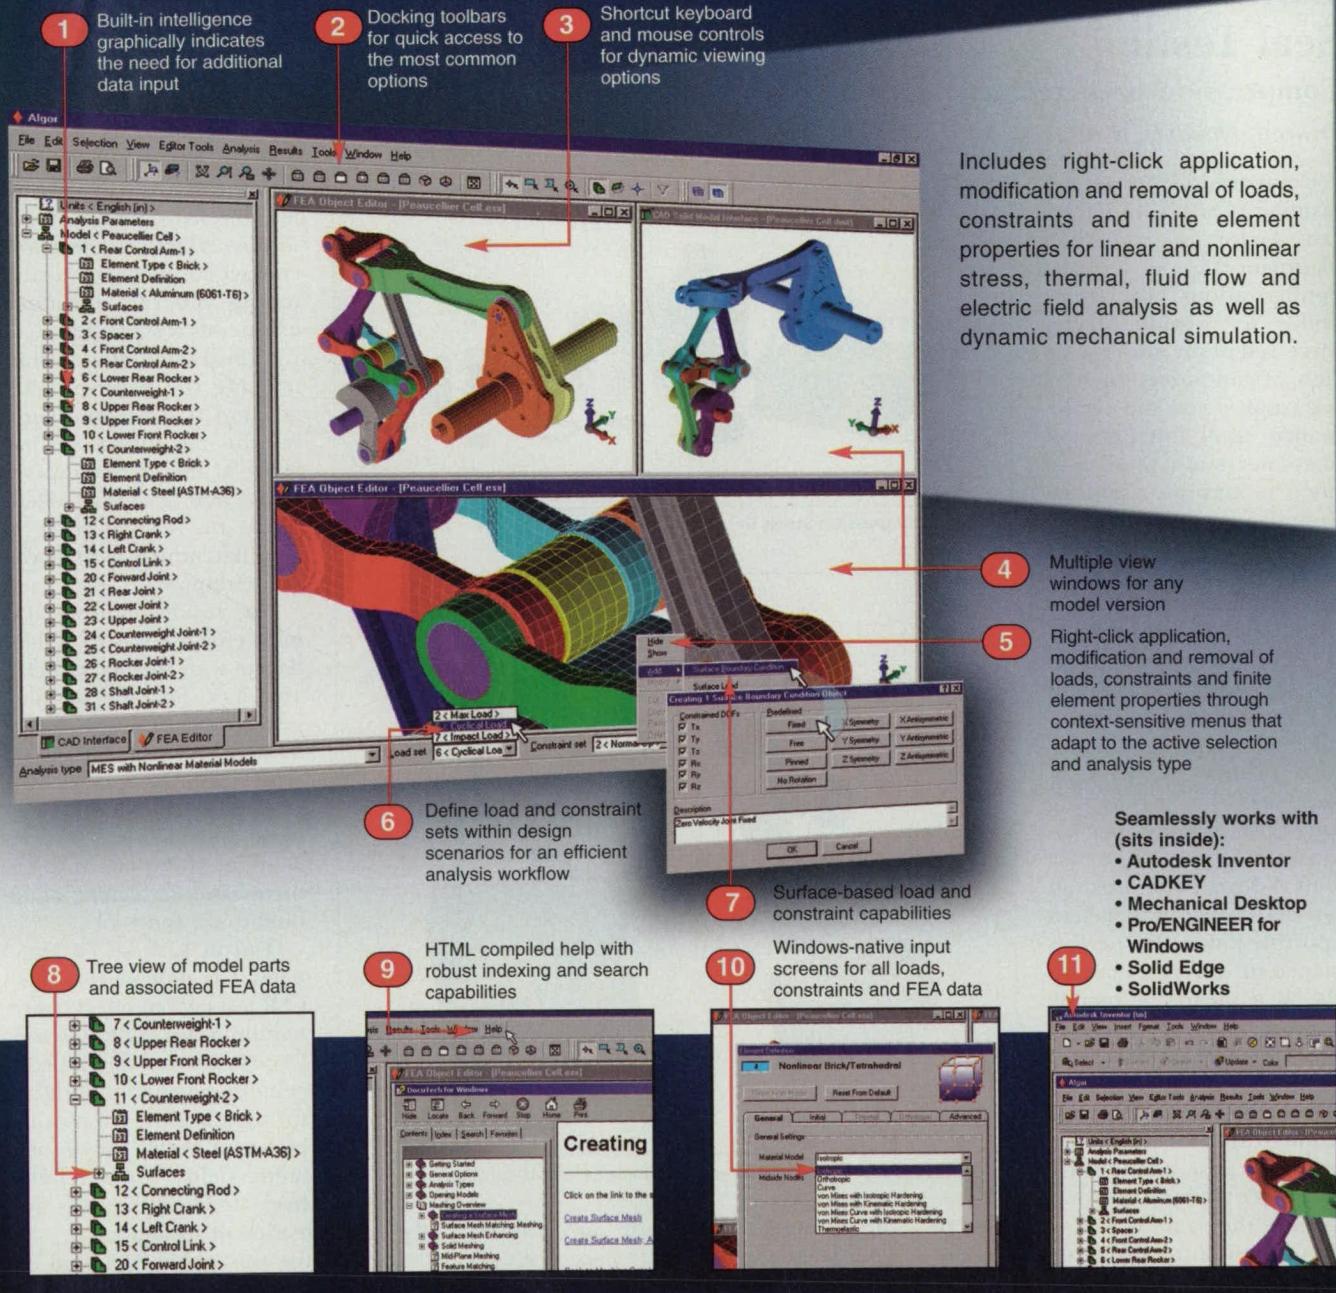

Prior to the advent of Enigma, these requirements were addressed individually, primarily by developing dedicated software or purchasing commercial-off-the-shelf (COTS) software. However, COTS software offered as many disadvantages as advantages. It was costly to purchase or develop COTS software that had to be converted in order to render it useful for multiple products. It was also costly to lose time waiting for procurement, development, and execution of products. Moreover, cooperative efforts were hindered by data-conversion requirements and by the unfamiliarity of engineering personnel with software tools procured or developed by other groups. Enigma overcame these disadvantages.

Enigma version 4.4 affords capabilities to build 3D solid models, define hierarchical relationships between models and other elements in the 3D environment, define and record animation on a video or computer disk, and generate graphical displays for simulation software. The program also features an on-line hypermedia documentation system. Enigma can be used as a stand-alone model-building, animation, and non-dynamic simulation software tool, and as a display driver to provide graphical support for other simulation software tools. The only support Enigma cannot supply is audio support.

## Obtaining Consistent, Reliable Results in Elastomer Seal Testing

Compression stress relaxation results help predict long-term sealing performance.

Dyneon, Oakdale, Minnesota

Compression Stress Relaxation (CSR) is an important factor in evaluating elastomer materials and seal configurations for their ability to provide sealing force retention under a variety of conditions. Increasing emphasis on the performance and longevity of elastomer seals, used most often in aerospace and automotive applications, is strengthening the need for more accurate CSR testing procedures.

CSR data is only valuable if different samples and test jigs provide consistent results. Obtaining reproducible, scaleable CSR results is now the primary emphasis for predicting long-term sealing performance.

In the past, compression set resistance was relied upon to judge the performance of different materials, as a means of quality control, and for specification purposes. CSR and compression set resistance can be used to estimate sealing capability; however, problems arise when different materials can be shown to have the same compression set resistance but different percentage of retained sealing force as measured with CSR. When using CSR methods, the sealing force will provide a direct correlation to sealing capability.

CSR testing equipment and methods can have advantages, as well as limitations, that can include cost, ease of use, jig size, test capability, and reproducibility. Since variables in each test method and differences in equipment can determine how accurate CSR test results are, it is important to differenti-

Figure 1: Compression Stress Relaxation samples and test jigs.

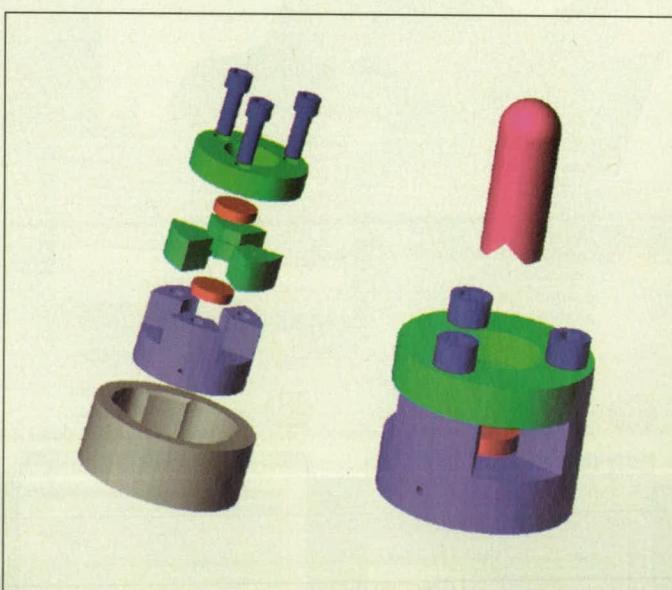

Figure 2: Loading Jig and Pin Indentor: Dyneon test configurations.

ate among equipment, procedures, and responses seen with each test configuration.

Equipment used to help collect sealing force retention data can provide benefits and challenges, depending on how each piece functions. A modified tensometer can provide the most information about sealing force, but only when a precise test configuration is used. Similarly, the success with a Shawbury Wallace tester that uses a contact break point method is also dependent upon a specific test configu-

ration because certain fluids or environmental conditions affect the electrical contact conductivity during testing and can introduce erroneous test results.

A third method of testing utilizing the Elastocon Relaxation tester is most useful for measuring sealing force at elevated temperatures, but does not reflect where the sealing force is lost first, which is at lower temperatures.

Test results indicate the most effective way to collect data is with smaller samples and jigs. Smaller samples generally are more representative of gasketing profiles or cross sections. Smaller test jigs also allow more samples to be evaluated in a smaller volume of liquid, making them easier to handle, drain fluid from, and cool.

Dyneon LLC, a 3M company, has designed a small CSR test jig that offers easier handling for CSR testing. Dyneon also has developed a centering jig and pin indentor to help limit the rocking effects of shims. This equipment yields better-defined load deflection curves for the determination of sealing force.

Test results show how frictional effects on jigs and samples can affect the variability of initial sealing force measurements. The use of lubricants and polished test surfaces will provide the best results. The advantage of the Dyneon jigs and others that use removable shims is that uniform frictional properties can be obtained by either repolishing or replacing the shims for a minimal cost.

Shape factor effects also are important to control during testing. Samples

with high shape factors show more variability due to the large change in sealing force with small changes in deflection. Also, their high compressive modulus makes it difficult to define the sealing force from changes in the slope of the load deflection curve. Using samples with lower shape factors appears to provide more consistent data. Samples with higher shape factors also appear to experience increased sealing force loss.

Sealing force is affected, in part, by changes in temperature — decreasing at lower temperatures and increasing at higher ones. Because of this, it is important to measure and control both the sample and jig temperatures when measuring sealing force. Dyneon's test jig provides a thermocouple well to allow for this measurement.

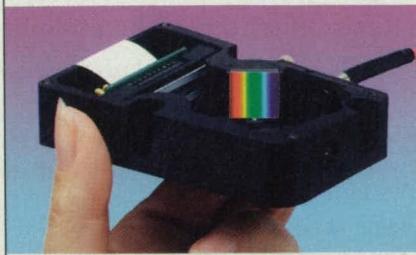

It is important to differentiate the sealing force responses that occur dur-

ing testing. Initial stress decay takes place when the compressed sample reaches an equilibrium-relaxed value at room temperature. Relaxation occurs when the sample is heated to a temperature above that at which it was compressed. This response is a result of thermal expansion, increased stress, and higher molecular motion that forces the polymer to relieve stress through molecular rearrangement. Aging effects, which are time-dependent, result from molecular bonds being formed or broken. This response is of most concern for predicting long-term durability or service life.

## Making Ion-Accelerator Grids From Ti Instead of Mo

Titanium grids last longer, cost less, and have greater strength/weight ratios.

*John H. Glenn Research Center, Cleveland, Ohio*

Titanium has been found to offer several advantages over molybdenum as the material used to construct electrostatic accelerator and -screen grids for ion thrusters for spacecraft. These advantages could also be expected to extend to the manufacture of grids for ion accelerators used in scientific research and the fabrication of semiconductors.

Titanium was chosen as the result of a search for a grid material that is less vulnerable to sputter erosion and from which grids could be fabricated at acceptably low cost. At a given current density, the volumetric rate of sputter erosion of titanium is about half that of molybdenum. Hence, in comparison with a thruster containing molybdenum grids operating at a given beam current density, a thruster of the same size containing titanium grids can last about twice as long; alternatively, the thruster containing titanium grids can last about the same amount of time when operated at twice the beam current density. Similarly, accelerators containing titanium grids could be operated at higher voltages.

The strength-to-weight ratio of titanium exceeds that of molybdenum, making it possible to reduce the weights of ion accelerators. The substitu-

tion of titanium for molybdenum does not entail any increase in the complexity of ion-accelerator design.

Titanium grids can be fabricated by use of photochemical-etching and hydroform processes heretofore used to make molybdenum grids for Glenn Research Center. Previously, attempts at photochemical etching of titanium were thwarted by the corrosion-resistant nature of titanium, but recent advances in photochemical etching have overcome this obstacle.

Finally, titanium offers the advantage of lower cost: at the time of reporting the information for this article, the cost per unit weight of titanium was 43 percent less than that of molybdenum.

## Mechanics

### Quasi-Fractal Lenticular Booms

Resistance to buckling would be increased.

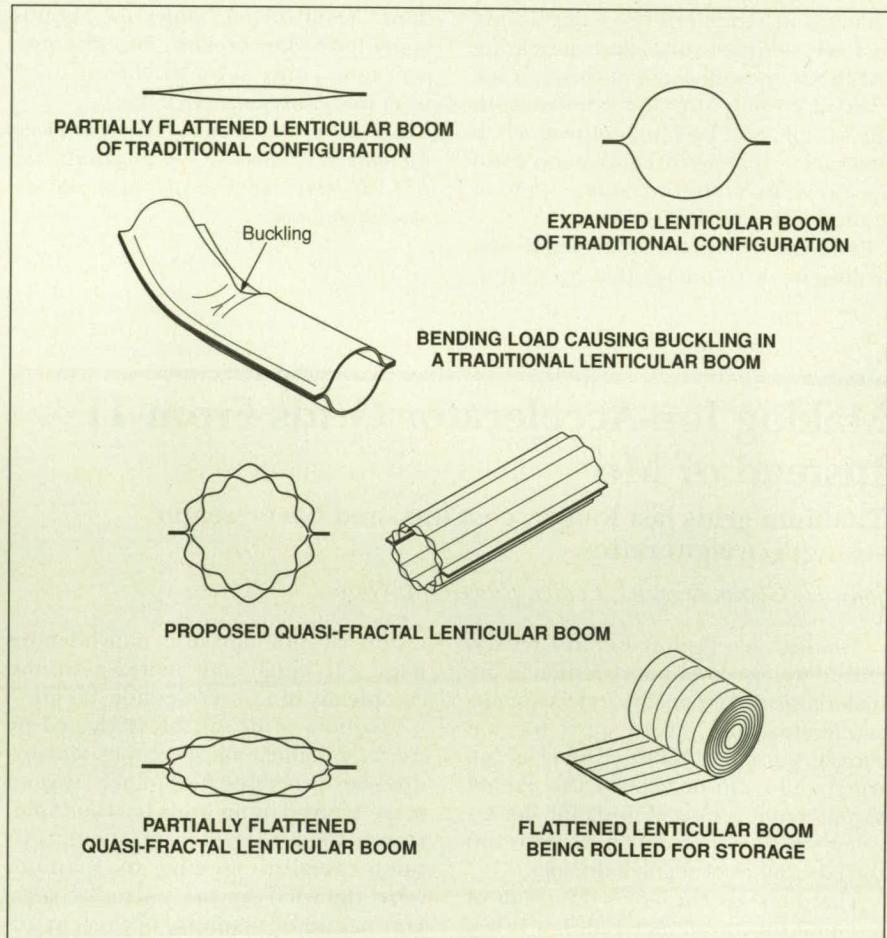

NASA's Jet Propulsion Laboratory, Pasadena, California

An improved configuration for large, thin-walled lenticular booms has been proposed to reduce their susceptibility to buckling. Lenticular booms have been used on spacecraft because they can be flattened and rolled onto drums for compact storage during transport, then deployed by unrolling them from the drums. Lenticular booms could also be useful on Earth in special applications in which there are requirements for lightweight, deployable structures that can withstand small mechanical loads.

Even when large lenticular booms have very thin walls, they can be made fairly resistant to bending, but because the walls are very thin and only slightly curved, they are not highly resistant to buckling. The figure depicts some lenticular booms in traditional and proposed configurations. According to the proposal, the thin, slightly curved wall of a traditional large lenticule would be replaced by a wall comprising multiple smaller lenticules that would have greater curvatures and would therefore resist buckling more strongly.

*This work was done by Donald Bickler of Caltech for NASA's Jet Propulsion Laboratory. For further information, access the Technical Support Package (TSP) free online at [www.nasatech.com](http://www.nasatech.com) under the Mechanics category.*

NPO-20815

Larger Lenticules Would Be Subdivided into smaller ones with larger curvatures to strengthen structures against buckling.

### Vacuum Pumping Station

John F. Kennedy Space Center, Florida

A proposed valve unit called a "vacuum pumping station" would be incorporated into a plumbing system that supplies a vacuum for vacuum insulated cryogenic equipment. The vacuum pumping station is intended to perform functions now performed by, and to be a simpler and more reliable alternative to, an assembly of components that include a vacuum-pump-out valve and a separate vacuum-isolation

valve (with a separate actuator) used to monitor vacuum levels. The present assembly includes a leak-prone threaded connection between the pump-out and isolation valve, and leaks can also occur at other locations. The vacuum pumping station would include a vacuum-pump-out port, a thermocouple port, a thermocouple-isolation valve, a pressure-relief valve, a pressure-relief port, and a single mechanism for actuating

the pump-out, isolation, and pressure-relief functions of the valve. The number of joints where leaks could develop would be only half that of the present assembly.

# Nonintrusive Pressure Gauges

Fluid pressure can be measured without interfering with measurement of mass flow.

Lyndon B. Johnson Space Center, Houston, Texas

The state of the art of pressure gauging has been advanced by the development of a new technique, and of a nonintrusive gauge based on the technique, for measuring the pressure of a fluid in the same segment of pipe in which the mass-flow rate of the fluid is also measured. NASA anticipates the first use of the technique in support of the High Flow Test Facility at White Sands Test Facility, and Kennedy Space Center has expressed interest in applying the technique on the X-33 aerospace launch vehicle. Nonintrusive pressure and flow gauges based on the present technique could also supplant older pressure and flow gauges in a variety of commercial processes and pressure systems in which the intrusion of gauges is known to affect local fluid dynamics.

Prior flowmeters and pressure gauges are subject to some limitations:

- Frequently, pressure gauges of prior design are attached to the outside walls of straight pipe segments, but intrusive wall taps are needed to couple fluid pressure to the transducers in the gauges. A wall tap can disturb the local flow profile and introduce fluid-entrapment zones and fluid-containment volumes.
- Straight-tube mass-flow meters of prior design do not measure pressures along with mass-flow rates.

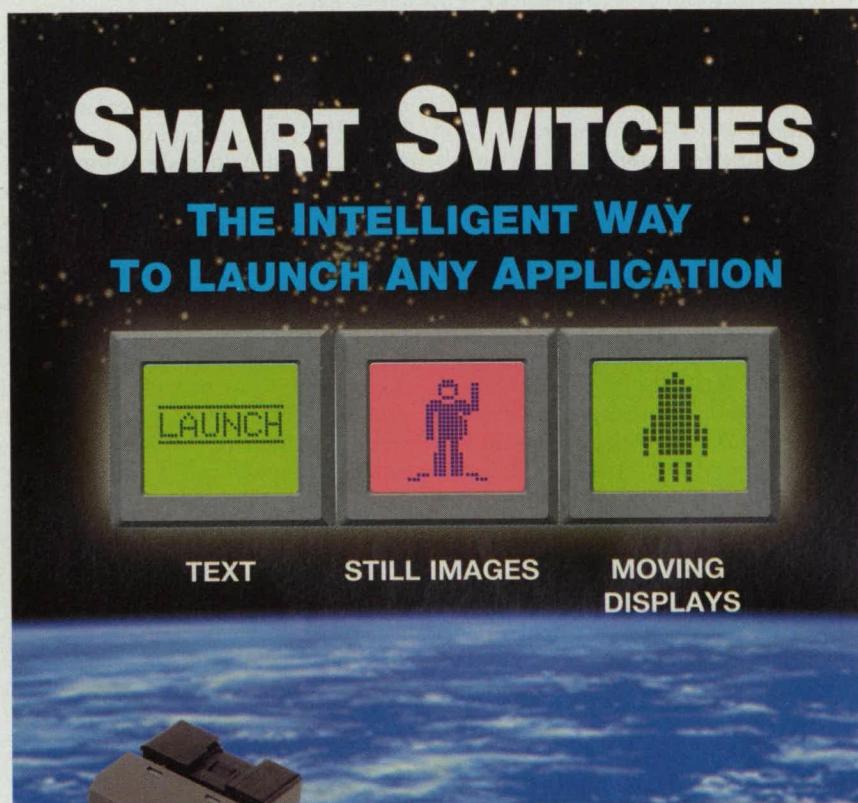

Gauges for simultaneous measurement of pressure and flow rate would be useful on NASA's space shuttle. An important consideration in the design of such gauges as retrofit items is that they are not allowed to intrude into the plumbing carrying the fluid to be gauged. Therefore, the present technique for measurement by an externally mounted, nonintrusive gauge was conceived. The technique offers the advantage of eliminating not only flow-disturbing intrusions into the plumbing but also the complications associated with implementation of pressure taps.

The present technique involves the use of a piezoelectric transmitting transducer, mounted on the outside of a fluid-filled pipe, to excite vibrations in the pipe. The transducer is driven by a voltage-tunable electronic power oscillator. A receiving transducer, also attached to the exterior surface of the pipe, is used to measure the frequency and phase of the vibrations. An external phase-locked-loop control circuit

ensures that the frequency of the power oscillator automatically tracks the resonance frequency of the selected vibrational mode of the pipe. The frequency output of the gauge can be coupled to external readout equipment by use of an optical fiber. The pressure of the fluid is then computed by use of the correlation between the fluid pressure

and the resonance frequency (the pressure varies approximately linearly with the frequency).

Because the only part of the gauge that comes in contact with the fluid is the pipe segment, which is already part of the plumbing, the nonintrusive pressure gauge can coexist with a mass-flow gauge that utilizes or is mounted in or

NKK's liquid crystal smart switches could be the brightest idea you ever had. They can be programmed to display numbers, characters, still images and moving graphics. They can also be programmed with switch-to-switch animation sequences that guide users through an error-free succession of even the most complex actuations. Regardless of your industry, don't launch another application without looking into NKK Smart Switches.

on the same pipe segment. Although the sensitivity of the present nonintrusive pressure gauge is lower than that of a typical intrusive gauge, the very fact of its nonintrusiveness enhances its potential utility. Once the issue of sensitivity

is addressed, the gauges based on the present technique could be expected to become tools of choice in commercial as well as aerospace applications.

## PVP-MP Method for Wrinkling Analysis of Space Membrane Structures

Distributions of stress can be predicted for taut, slack, and wrinkled areas.

NASA's Jet Propulsion Laboratory, Pasadena, California

Parameter-Variation-Principle (PVP) based Mathematical Programming (MP) is the basis of a computational method of analyzing wrinkles in membranes. Devised for original application to lightweight membrane structures in outer space, the method can also be applied on Earth to similar structures, to diverse industrial products that include paper and textiles, and to structures made from these products.

PVP is a variational principle, for which some of membrane strain components, unlike in a traditional variational principle, do not participate in functional variation. PVP is suitable for ana-

lyzing wrinkled membranes because it is valid for all three general membrane conditions — taut, slack, and wrinkled. With PVP, the traditional problem of membrane wrinkling is transformed to a mathematical programming problem, which can be efficiently solved by numerical methods. As a result, the present PVP-MP method guarantees numerical convergence for all three conditions. In this method, one uses an optimization technique instead of traditional iteration to search for the minimum of this principle. This search guarantees convergent numerical solutions with finite steps in computation.

A membrane by itself usually has very little resistance to in-plane compression and very little stiffness against out-of-plane bending. Out-of-plane stiffness is usually imparted to a membrane through pretensioning. Therefore, out-of-plane stiffness is a function of the distribution of in-plane stress. Wrinkles appear when some areas of a membrane are subjected to in-plane compression to a certain level; indeed, the formation of wrinkles is a membrane local-buckling phenomenon.

Ordinary stress analysis procedures are limited in predicting wrinkles. Numerical iteration methods for wrinkling analysis used heretofore to analyze wrinkles apply different values of membrane material properties, depending on whether it is taut, slack, or wrinkled. These methods often present difficulties that prevent or impede convergence or that lead to incorrect solutions.

The present PVP-MP method guarantees accurate results with much less (relative to prior methods) computational effort. The method involves two main steps. In the first step, one develops a PVP principle, including a controlling parameter vector. With the help of the controlling parameter vector, taut, slack, and wrinkled states of the membrane can be represented by one variational principle. In the second step, one searches for the minimum of the variational principle by use of the applicable optimization technique. Because the search can reach the minimum of the variational principle at the exact solution, this method can predict the distribution of stress throughout the membrane, including any taut, slack, and/or wrinkled areas.

# Manufacturing/Fabrication

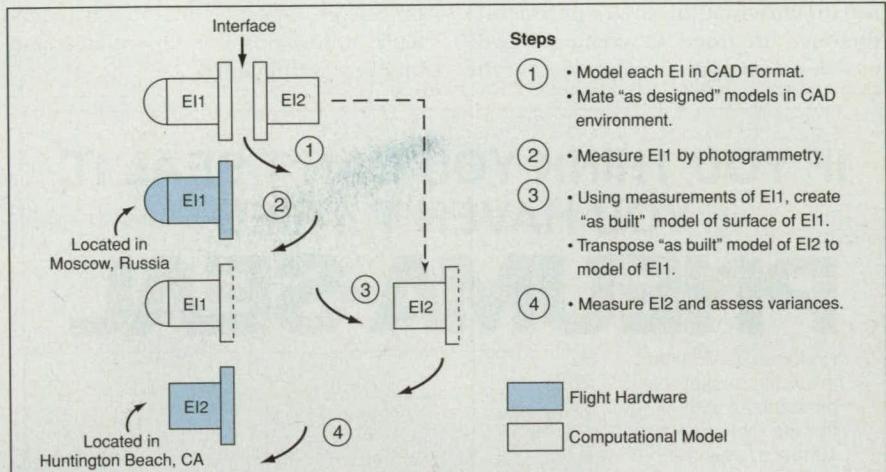

## Digital Preassembly Process

Assembly of major elements of large structures is simulated in a CAD environment.

*Lyndon B. Johnson Space Center, Houston, Texas*

Because the International Space Station is being assembled in orbit, there was a need to verify in advance that it could, indeed, be assembled there and that the various assembled parts would function as intended. A digital preassembly process was devised to satisfy this need for verification, without having to perform assembly on Earth. The process enables designers to simulate the assembly of major elements of large structures by use of a computer-aided design (CAD) system. The process could also be applied in any type of manufacturing and in many types of construction.

The verification problem arises because Space Station components are being produced by subcontractors scat-

Computational Models of mating end items (EIs) are refined by use of photogrammetry and used to simulate mating, in order to detect potential obstacles to final assembly.

### FH Series Marking Head

Now available with marking-on-the-fly!

## CO<sub>2</sub> Laser Marking Solutions

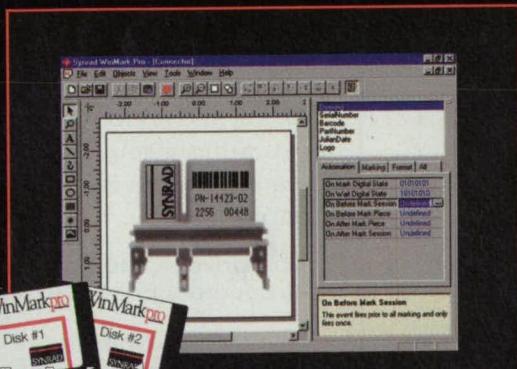

Low cost, easy-to-integrate laser technology for OEMs and Systems Integrators

Synrad has made it easier than ever to incorporate CO<sub>2</sub> lasers into industrial marking systems with a full range of laser marking components that are flexible, easy to integrate, and affordable.

CO<sub>2</sub> lasers can be used to mark a wide range of materials - and, lasers offer a number of benefits over other marking technologies, including less maintenance and higher throughput.

In fact, Synrad offers all the components you'll need to assemble a complete laser marking system (you supply only a PC)- including the software!

**SYNRAD**

An Excel Technology Company

tered across the United States and by international partners. Costs and schedule restrictions prohibit either building a full scale, high-fidelity mockup or shipping Station components to different locations for design verification. Components being built in Russia, Japan, Europe, and Canada will not be available for pre-launch interface tests with those components built in the United States.

In the digital preassembly process, two-dimensional hardware-production drawings are used to create three-dimensional computational models of the

structural elements or other end items (EIs) that mate at a given interface (see figure). The process includes modeling of the mating surfaces and hardware as well as all external components installed near a stay-out zone (a region in the vicinity of the interface that must be kept clear of any potential obstruction). The process includes identification of any off-nominal variances of mating surfaces, alignment and latching components, externally mounted components, fluid lines, or cables that could potentially encroach on the stay-out zone and interfere with mating.

Once the EIs on both sides of the interface have been modeled as designed, mating is simulated in the CAD environment. Portable digital photogrammetric equipment is then used to measure the real EIs. These measurements are mapped back into the computational model, creating an as-built computational model of the mating EIs. The revised computational model of the first-measured EI (say, EI1) is loaded into the computer of the portable digital photogrammetric equipment, which is moved to the location of the other EI (EI2) when that EI becomes available. The revised computational model is then used to perform a digital mating, which helps to identify variances between mating elements and potential interferences that could create problems during mating. Thus, the digital preassembly process provides early indications of potential problems in mating and assembly. The data gathered in the digital preassembly process could also be mapped into flight-element parametric models (when available) to extend the assessment to more dynamic thermal and pressure conditions.

## IF YOU THINK YOU CAN'T SEAL IT, YOU HAVEN'T TRIED **PNEUMA-SEAL®**

Pneuma-Seal® is an inflatable gasket that is pressurized with air. It fills the gaps between surfaces, even hard-to-seal uneven surfaces. When deflated, Pneuma-Seal quickly retracts preventing interference when opening and closing a door or cover.

Use Pneuma-Seal as an effective barrier against pressure differentials and to seal out water, dust, gas, chemicals, noise and other contaminants.

### Typical applications include:

**Processing equipment:** chemical, food, textile, pharmaceuticals, dryers, ovens and where **rapid sealing and unsealing** are required.

**Pollution control:** sound attenuation, hopper seals.

**Laboratory facilities:** test equipment, clean rooms.

**Transportation:** military vehicles, aircraft, shipboard, mass transit doors and hatches.

**Construction:** special purpose doors, flood protection.

### Pneuma-Seal is particularly suitable for:

**Large enclosures** where it is uneconomical to machine the entire sealing surface.

**Uneven fabrications** where traditional compression gaskets or latches are ineffective.

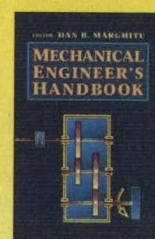

**Horizontal or vertical sliding doors** or covers that would tend to drag on and abrade conventional seals.

**Hinged doors** where **flush thresholds** are required.

## Numerical Index for Quantifying Aircraft Icing Hazards

This index would offer several advantages over the present four-level index.

*NASA's Jet Propulsion Laboratory, Pasadena, California*

A new method for assessing and communicating aviation in-flight icing hazards has been proposed. This methodology creates a simple numerical index for quantifying hazard severity. The index is traceable to flight-level meteorology and aircraft-specific, icing-induced reductions in aircraft performance. It also provides a connection to a statistical data base of icing meteorology. This system will clarify the terminology used to describe the degree of danger posed by specific meteorological conditions. The relationship between hazard severity and meteorology is related by measured ice accumulation rates observed on a standard airfoil under prescribed conditions. This system has greater fidelity than the existing system and is applicable to all types of air vehicles.

The proposed numerical index is based on a multidimensional matrix representation of meteorological parameters that pertain to icing. For example (see Figure 1), suppose that ice-accretion rates for a given aircraft could be determined from three parameters; the outside air temperature, the fraction of cloud water droplets with diameters  $>100\text{ }\mu\text{m}$ , and the liquid density (the vol-

ume of water per unit volume of air). The three-dimensional space for these three parameters would be segmented into cells, each representing a unique meteorological state. Each cell could be assigned a probability of occurrence estimated from meteorological data bases. Aircraft manufacturers would then be able to specify surfaces in the three-dimensional parameter space that bounds safe operating conditions for each of their aircraft for various ranges of exposure times. Thus, the meteorological matrix concept would provide traceability among meteorological conditions, aircraft performance, and cumulative probabilities of occurrence of icing.

To reference each level of the proposed index to the degree of hazard, the index would be related to measured rates of ice accumulation on a standard wing cross section. The rates would be measured over a wide range of meteorological conditions for a standard set of flight conditions (such as airspeed and angle of attack). Aerodynamic modeling software could then be used to translate the observed icing phenomena to commercial airfoil shapes with some confidence.

The proposed index would feature some number of levels — possibly 12 —

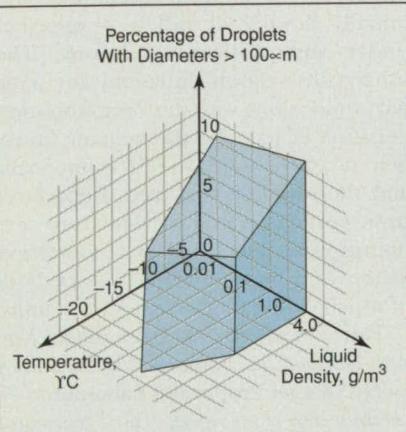

Figure 1. A Meteorological Matrix would be used to characterize the range of meteorological conditions that pose in-flight icing hazards. The shaded region is a fictitious example of a boundary defining the region for safe operation of a specific aircraft.

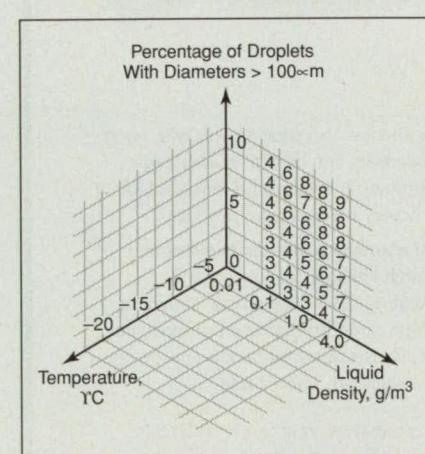

Figure 2. Hazard Indices ranging from 3 to 9 have been placed in the cells in one plane of a meteorological matrix. The hazard indices shown here constitute a fictitious example.

chosen to increase the fidelity of reporting beyond that of the current four-level system, without making the levels so narrow that the differences between them could not be reasonably measured. The levels would be assigned to cells in meteorological matrices (see Figure 2). The twelve-level scale would be related to the present four-level system in the following way: Zero would represent meteorological conditions that do not induce icing; three through six would correspond to the "light" level; seven through nine would correspond to the present "moderate" level; and 10 to 12 would correspond to the present "severe" level. The correlations between measured icing rates, the present four levels, and the proposed index would be established in a consensus process that would involve airlines, pilot organizations, government, and aircraft manufacturers.

## DNS of Mixing of Supercritical Heptane and Nitrogen

*NASA's Jet Propulsion Laboratory, Pasadena, California*

A report discusses direct numerical simulations (DNS) of a developing mixing layer between nitrogen and heptane initially at different temperatures and initially flowing at different velocities under supercritical conditions. The usual conservation equations for a binary fluid, along with the Peng-Robinson equation of state for the heptane/nitrogen mixture, were solved numerically and the solutions analyzed. Departures from perfect-gas and ideal-mixture conditions were quantified by compression factors and mass-diffusion factors, both of which exhibited decreases from unity.

## Books & Reports

### Gas Generator for Inflating Structures in Outer Space

A report proposes a system that would supply gas for inflating one or more inflatable structure(s) in outer space. The system would include a small tank of helium for initial inflation, plus a catalytic hydrazine gas generator that would supply makeup gas over the long term. After initial inflation, when makeup gas was needed, liquid hydrazine from a tank would be made to pass through a catalytic bed, where it would become decomposed into a mixture of N<sub>2</sub>, H<sub>2</sub>, and a small amount of NH<sub>3</sub>. This gaseous mixture would constitute the makeup gas and would be stored in the tank that previously contained the helium. The makeup gas would be released from the tank to the structure(s) as needed. In comparison with an inflation system based only on compressed gas stored in tanks, the proposed inflation system would offer the advantage of lower mass: About 25 percent of the masses of representative previously contemplated large inflatable outer-space structures would have been contained in their inflation systems. In contrast, the mass of the proposed inflation system has been estimated to be only about 13 percent of the total mass of a representative structure.

This work was done by Larry Roe of Caltech for NASA's Jet Propulsion Laboratory. ### Thermal Insulation Would Use CO<sub>2</sub> in the Martian Environment

A report describes the development of a lightweight thermal insulation system for Martian surface applications. The ambient Martian atmosphere, which is predominantly carbon dioxide at a pressure of 10 torr, is used as the insulation medium with a modest multiple radiation shield enclosure. The carbon dioxide has a thermal conductivity that is very close to traditional insulation, and

the carbon dioxide is naturally available on the Martian surface. Preformed Mylar spacers that are affixed to the hardware create the necessary standoff distance from the enclosure.

*This work was done by Gajana Birur, Glenn Tsuyuki, and James Stultz of Caltech for NASA's Jet Propulsion Laboratory. To obtain a copy of the report, "Novel light weight Thermal Insulation for Martian Environment using Carbon Dioxide gas," access the Technical Support Package (TSP) free on-line at [www.nasatech.com](http://www.nasatech.com) under the Materials category.*

### Martian Landing Balls

A report describes Martian landing balls, which are under development for use in delivering scientific payloads to Mars. Martian landing balls are related to other soft-landing devices that resemble beach balls and that have been described in several previous *NASA Tech Briefs* articles. They are also related to the Zorb (or equivalent) — a commercial recreational device that looks like a large, transparent beach-ball/tire hybrid with a central volume that is open to the atmosphere and that accommodates a human rider. In a Martian landing ball, the central volume contains a rigid cylinder that carries the payload. The cylinder is surrounded (except for small openings) by an approximately spherical airbag. In the intended use, Martian landing balls would be dropped from slowly descending solar-heated balloons. It has been estimated that a Martian landing ball with a mass of 2 kg could deliver a 10-kg payload with a landing acceleration of less than 50× normal Earth gravitation (less than about 490 m/s<sup>2</sup>). Once on the Martian surface, the airbag could be deflated; alternatively, the airbag could be kept inflated to take advantage of the wind to blow the payload to a desired location.

*This work was done by Jack Jones, Andre Yavrouian, and Tim Connors of Caltech for NASA's Jet Propulsion Laboratory. To obtain a copy of the report, "Martian Landing Ball," access the Technical Support Package (TSP) free on-line at [www.nasatech.com](http://www.nasatech.com) under the Mechanics category.*

## New on the WEB

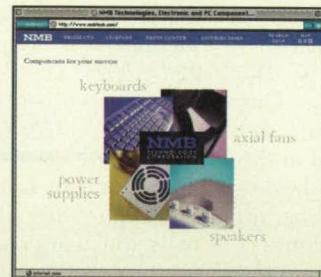

### Hydraulic Flanges

Main Manufacturing, Grand Blanc, MI, has instituted a new Web site with information on hydraulic flanges. The interactive site allows the user to build a flange, obtain the specifications and model code, and submit an RFQ. Technical support and printed literature also are offered. [www.mainmfg.com](http://www.mainmfg.com)

### Fans and Blowers

A redesigned site by NMB Technologies Corp., Chatsworth, CA, provides information on axial fans, blowers, power supplies, speakers, and keyboards. Included are datasheets, on-line model locators, and real-time inventory checking of fan products, which allows customers to locate and purchase fans from participating distributors. [www.nmbtech.com](http://www.nmbtech.com)

### Seal Materials

ExpressSeal™, Lancaster, NY, has launched a new Web site on the computerized manufacturing technology used to produce seals such as U-cups, wipers, piston rings, bushings, bearings, packings, O-rings, prototypes, and custom seals and shapes. Available seal materials also are described. [www.expressseal.com](http://www.expressseal.com)

### Heating and Control

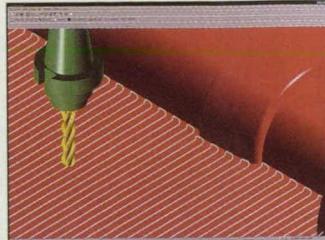

Chromalox, Pittsburgh, PA, offers installation guides, instruction sheets, free downloadable software, and a Design Wizard for users seeking information on electric heat and control products such as heaters, cables, and sensors. The KnowledgeBase feature includes archived material, commercial issues, research data, and product information. [www.mychromalox.com](http://www.mychromalox.com)

# New on DISK

## CAD/CAM

SURFCAM 2001 CAD/CAM software from Surfware, Westlake Village, CA, features high-speed machining for machine motion and plunge roughing, an updated NC editor with back-plotting, right-click menu, and live update technology. Parameter associativity allows toolpath parameters such as tool numbers, offset registers, and feed rates to change without repeating the steps required to create the toolpath. The software also features enhanced design and solid modeling features. **For Free Info Circle No. 717 or Enter No. 717 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

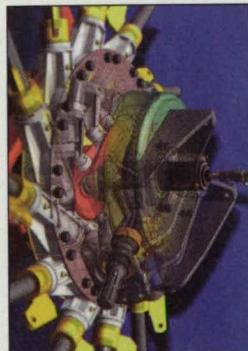

## Drawing and Diagramming

Microsoft Corp., Redmond, WA, has released Microsoft® Visio® 2002 drawing and diagramming software that features Web integration and publishing capabilities for collaboration via the Internet. It also includes Extensible Markup Language (XML) capabilities, support for Component Object Model (COM) add-ins, and adoption of industry standards. The two primary products are Visio Standard for creating flowcharts, organizational charts, and timelines; and Visio Professional for IT professionals and software developers. **For Free Info Circle No. 718 or Enter No. 718 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Mechanical CAD

UGS, Cypress, CA, has announced Solid Edge Version 10 mechanical CAD software that focuses on large-assembly design and drafting.

Enhancements include tools that streamline modeling of families of assemblies and alternate position assemblies, a drawing view tracker, part/feature/assembly color options, translator enhancements, curve and surface modeling, pipe threading, and a new collaboration Web portal service called Edge eXchange. Users can create subassemblies, disperse subassembly components, and change the order of parts while maintaining all positioning relationships. The software provides a built-in Parasolid to ACIS bi-directional translator for interoperability with CAD tools based on the ACIS solid modeling kernel. A healing technology automatically finds and corrects faults in imported 3D CAD data. **For Free Info Circle No. 719 or Enter No. 719 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Numerical/Visual Analysis

JWAVE 3.5 from Visual Numerics, Boulder, CO, is a client/server solution that utilizes Java components to develop and deploy applications across an enterprise via the Internet or an intranet. JWAVE lets users who are developing applications using Java or HTML to perform numerical analysis and visual interpretation of complex datasets. Users can zoom in or out of a chart, profile a row or column across an image, select a point on a chart, and interactively rotate a 3D chart. **For Free Info Circle No. 721 or Enter No. 721 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Serious FEA

Structural failure is simply unacceptable when you're pulling 8G's at 600 mph. Or depending on a spinal implant. Or an automotive fuel tank. Or the mast of an America's Cup contender. This is why developers of the most critical structures depend on **NE/Nastran** for FEA analysis.

Along with uncompromising accuracy, **NE/Nastran** is one of the most complete, easiest-to-learn-and-use FEA packages available. And it's yours for 1/3 to 1/10 the price of comparable software.

**Free Demo.** We're so sure that you'll see the value in **NE/Nastran** that we want you to use a demo version for free.

It runs on Windows 95/98/NT4.0/2000 with Unix and Linux versions available soon. Visit our web site to learn more about this serious FEA, and download your free evaluation copy.

Upgraded F-5E fighter avionics bay, radar support structure, and wing analyzed using **NE/Nastran**.

## Now available in the NASA Tech Briefs bookstore: **Encyclopedia of the Solar System**

Edited by

Paul R. Weissman and Torrence V. Johnson of  
NASA's Jet Propulsion Laboratory

Foreword by Sally K. Ride

"Four decades of the most exciting explorations in human history in one book! Up-to-the-minute details by the best writers to explore the solar system are wonderfully organized for both looking up quick facts and for in-depth study. This one pulls it all together. Any citizen of the solar system from age 8 to 80 should own this encyclopedia."

— Dr. Jay Apt, Director, Carnegie Museum of Natural History,  
four-time Space Shuttle Astronaut

Superbly illustrated with images from the Hubble Telescope and other observatories.

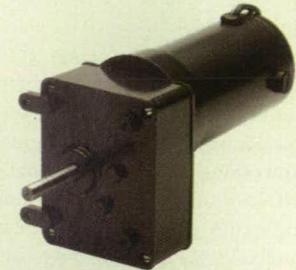

Hardcover • 992 Pages • Discount price: \$96.95

# New on the MARKET

## Shaft Gearmotor

RAE Corp., McHenry, IL, offers the G209 series permanent magnet, brush-type, DC parallel shaft gearmotor for pumps, conveyors, medical equipment, and small vehicles. The gearmotor features long gear life, reduced noise, balanced armature, high-energy ceramic magnets, externally replaceable brushes, and class "F" insulation. Other features include gear ratios from 10:1 to 2328:1, ratings up to 50 inch-pounds, 12 to 90 V (DC), and speeds of up to 350 rpm. **For Free Info Circle No. 725 or Enter No. 725 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Circular Chart Recorder

OMEGA Engineering, Stamford, CT, has released the CT1901 programmable circular chart recorder for up to four process signals. Pen ranges are individually set for each signal. Users can see the status of a process at a glance. Six-digit displays provide an indication of up to four process values simultaneously, as well as active alarm flashing LEDs. Features include thermocouple, RTD, voltage, current inputs, and a user's choice of one to four pens. User-configurable math functions, mass flow calculations, and RH tables are supported. **For Free Info Circle No. 726 or Enter No. 726 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Pressure Sensor

The P4000 pressure sensor from Kavlico, Moorpark, CA, incorporates MEMS technology into an all-welded, stainless steel package. The transducer is suited for HVAC-R, off-highway vehicles, pressurized tools, adaptive suspension systems, material testing, hydraulic press monitoring, and other hydraulic applications. The sensors are available in pressure ranges of 0-100 through 0-8000 PSI absolute or sealed gage. The sensor has a total error band of  $\pm 1\%$  over the operating temperature range of -20°C to 100°C. **For Free Info Circle No. 728 or Enter No. 728 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Coated Wire

California Fine Wire, Grover Beach, CA, offers custom wire fabrication with PTFE (polytetrafluoroethylene) coatings that can be enameled to 1,000 metals and alloys. The PTFE-coated wire is put inside tubing and is drawn to a small diameter, creating a coaxial cable. Liquefied PTFE is applied to fine wires in continuous lengths of up to 10,000 feet. PTFE-coated wire is appropriate in environments where wire-related products, including microprocessor-controlled equipment, is exposed to corrosive chemicals. **For Free Info Circle No. 730 or Enter No. 730 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

# New LITERATURE

## Metals and Coatings

General Magnaplate Corp., Linden, NJ, offers a friction data guide on CD that aids engineers in selecting combinations of metals and coatings that improve the service life of mating components. The guide shows comparisons of the coefficients of friction between combinations of treated and untreated surfaces. **For Free Info Circle No. 710 or Enter No. 710 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

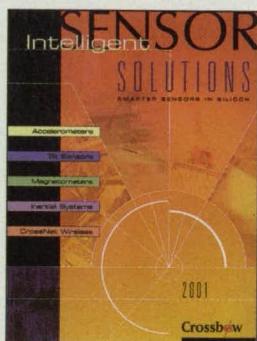

## Thermoelectric Coolers

A four-page brochure from Melcor, Trenton, NJ, describes thermoelectric coolers for telecom applications. The coolers feature operating temperatures from 93°C to 232°C, and Pb-free construction solders up to 271°C. Other features include custom sizes, power densities, and ceramic patterns; and wire bondable posts, metallized pads, and wires. **For Free Info Circle No. 711 or Enter No. 711 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Rail Assembly Guide

WAGO, Germantown, WI, has released ProServe Software Version 2.5 for custom rail assembly that allows customers to design, mark, document, and test their own rail-mounted terminal block assemblies. The CD includes a product locator, allowing users to search a database of over 9,000 parts according to product groups, part numbers, key words, and technical data. **For Free Info Circle No. 712 or Enter No. 712 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

## Sensors/Accelerometers

Crossbow Technology, San Jose, CA, has released a 95-page catalog highlighting accelerometers, sensors, magnetometers, inertial systems, and wireless products. The catalog features various products utilizing the Bluetooth wireless technology, and analysis and evaluation software. **For Free Info Circle No. 715 or Enter No. 715 at [www.nasatech.com/rs](http://www.nasatech.com/rs)**

A large advertisement for Photron FASTCAM systems. The background is a dark wood panel wall. In the foreground, there are several pieces of equipment: a green printed circuit board labeled "FASTCAM-PCI", a black rectangular camera unit with a lens, and a smaller control unit with a keypad and display. The text "High Speed High Performance High Quality" is overlaid in large, bold, white letters across the middle of the image.

**FASTCAM**

That's why you've chosen Photron FASTCAM systems as the industry standard high-speed imaging products.

Now, we bring you more of what you've come to expect from Photron!

Photron announces direct product distribution and support in the United States and Europe. Contact us – [image@photon.com](mailto:image@photon.com), by telephone at 1-800-585-2129 or face-to-face at your facility. Photron's experienced personnel understand your applications and are always ready with the answers to all your questions.

Here's what we mean! Up-to-date and up-to-speed!

Launched in early 2001, the FASTCAM-Ultima 1024, developed around the latest C-MOS imaging sensor using cutting-edge technologies, provides the world's first megapixel resolution high-speed digital imaging system with 500 fps full frame operation and frame rates up to 16,000 fps with reduced resolution

The FASTCAM-PCI provides an economical PCI card-based, high-speed camera solution. The system offers flexible operation at frame rates from 250 to 10,000 fps as an image-capturing peripheral device for the PC.

## MERCURY SLIP RINGS

Bulletin describes rotating electrical connectors that combine mercury with compatible metals for stable, noise-free connections. Conductors are immersed in separate pools of mercury. Shielding protects the mercury and electrodes. The corrosion-resistant connectors have ball bearing construction to minimize seal wear and are suited for sensitive circuits with milliamp signals. Up to 8 channels are available with electrical capacities to 30 A at 240 VAC. Mercotac, Inc., 6195 Corte del Cedro, #100, Carlsbad, CA 92009; Tel: 760-431-7723; Fax: 760-431-0905; [www.mercotac.com](http://www.mercotac.com)

## NEW INVENTORS VIDEOS TEACH LAW & BUSINESS

Save time and money by learning how to patent your ideas, how to build a profitable business, and how to make the law work for you. This premium video series by Patent Attorney Randy Notzen teaches inventors everything from start to finish about patents and inventing. Protect your invention, learn the laws and tricks of the trade. This expanding 10-volume set of informative and easy-to-understand videos is available. Info Line: 888-258-5164, or order online at [www.InventorsInsider.com](http://www.InventorsInsider.com)

## WAVE SPRING CATALOG

New 2001 Wave Spring Catalog! Smalley has over 1800 springs in stock with sizes from 3/8" to 16". Special designs range from 9/32" to 84"; carbon and stainless steel are available. Smalley offers a No-Tooling-Cost™ manufacturing process. All Springs Are Not Equal®. Save up to 50% more space with Smalley. Call today and speak with one of our engineers to get FREE design assistance. Smalley Steel Ring Company, 385 Gilman Avenue, Wheeling, IL 60090; Tel: 847-537-7600; Fax: 847-537-7698; email: info@smalley.com; website: www.smalley.com

## P4000 SENSORS

Ideal for a wide array of hydraulic applications, the compact sensor design provides increased mounting flexibility and ease-of-installation. Sensor utilizes MEMS technology and has an all-welded stainless steel package that can withstand harsh environments and high vibration. Pressure ranges from 0-100 to 0-8000 PSI absolute or sealed gage. Voltage output. Electrical and Process connection options. Kavlico, a C-MAC Company, 14501 Los Angeles Ave., Moorpark, CA 93021-9738; Tel: 805-523-2000; Fax: 805-523-7125; website: [www.kavlico.com](http://www.kavlico.com); email: sales@kavlico.com

## PRESSURE TRANSDUCER WITH BRASS HOUSING

The P168/P168R pressure transducers are available in 5 Vdc regulated (0.5 to 4.5 Vdc signal output) or 7-30 Vdc unregulated (1-5 Vdc signal output).

Pressure ranges from 0-15 to 0-500 PSIG/PSIA. Utilize ceramic capacitive sensing technology for excellent repeatability, accuracy, and stability. EMI protected. Suitable for a wide array of liquid, gas, and vapor measurements. Kavlico, a C-MAC Company, 14501 Los Angeles Ave., Moorpark, CA 93021-9738; Tel: 805-523-2000; Fax: 805-523-7125; website: [www.kavlico.com](http://www.kavlico.com); email: sales@kavlico.com

## HIGH PERFORMANCE BRUSHLESS D.C. MOTORS

ARC Systems, Inc. offers custom BLDC motors. ARC Systems, Inc. uses high energy materials to meet the rigid performance requirements of our customers. ARC Systems, Inc. is committed to producing highly technical designs at unbeatable prices. We specialize in 2 Wire Brushless D.C. Motors with the Controller built in. ARC Systems, Inc., 2090 Joshuas Path, Hauppauge, NY 11788; Tel: 516-582-8020, 800-893-3649; Fax: 516-582-8038; email: [ARCUSERVE@aol.com](mailto:ARCUSERVE@aol.com); website: [www.arcsystemsinc.com](http://www.arcsystemsinc.com)

## Official NASA Logo T-Shirts

NASA vector logo on quality white cotton shirt.

Available in adult and youth sizes. \$13.95 + shipping.

Order online:  
[www.nasatech.com/store](http://www.nasatech.com/store)

## Fundamentals of Fluid Mechanics

*Third Edition Update*

Bruce R. Munson, Donald F. Young, and Theodore H. Okiishi

This seminal text comes with a free Fluid Mechanics Phenomena CD-ROM that brings fluid mechanics to life. Video segments illustrate how fluid motion is related to familiar devices and everyday experiences.

Cloth/CD-ROM • 896 pages  
Discount price: \$97.95

Order online:  
[www.nasatech.com/store](http://www.nasatech.com/store)

## Rocket Propulsion Elements

*Seventh Edition*

George P. Sutton and Oscar Biblarz

The single most authoritative sourcebook on rocket propulsion technology — now completely revised to reflect rapid advancements in the field. Guides readers through the complex factors that shape propulsion, with both theory and practical design considerations.

Hardcover • 768 Pages  
Discount price: \$96.95

Order online:

## Are you Sure You have A Good Design?

Will it overheat? Will the stresses be too high? Will it break? If you are designing your models without using analysis, you could be risking a potential part failure - without even realizing it.

Don't take unnecessary chances with your design. Use COSMOS/™ throughout the design cycle to help identify potential problems before it's too late.

**COSMOS/WORKS**  
**COSMOS/DESIGNSTAR**

With COSMOS/, engineers are building better, more cost efficient products while taking weeks, even months off of the design cycle.

COSMOS/ tackles even the most complex design tasks, while being intuitive enough for any engineer to quickly learn and use, regardless of previous experience.

For information on how COSMOS/ can help you work smarter instead of harder and a **FREE** 15-day trial, call us today at **1-800-469-7287** or visit us online at <http://nasa.cosmosm.com>.

## Robotic Arm Designed with FEA & CAD Software

COSMOS/Works finite element analysis software  
Structural Research & Analysis Corp. (SRAC)  
Los Angeles, CA  
310-207-2800  
[www.cosmosm.com](http://www.cosmosm.com)

Under contract to NASA's Jet Propulsion Lab, Alliant Space Systems Inc. (ASI) of Pasadena, CA ([www.asi-space.com](http://www.asi-space.com)) is designing the robotic arm for the Mars Exploration Rover (MER) project, which will send twin rovers to Mars in 2003. The five-degrees-of-freedom arm is one meter long with scientific instruments at the end. It has five actuators, moving joints, and conductor wires, and must meet requirements for stiffness and mass. ASI used COSMOS/Works software for stress analysis and mass minimization during the design process.

Jim Staats, ASI's chief engineer, noted that mass is the crucial component of any space mission. "You just can't get there from here if you can't get the mass within the envelope," he said. Because its protective aeroshell can hold only so much mass, the MER lander must be within limits. Other crucial factors are the extreme temperatures on Mars, ranging from -184°F to +176°F, and the 50 to 60 mph impact of landing.

Each of the two rovers will drive to its likely location, extend its mechanical arm, and hold its instruments near a rock. The

arm will rotate so each instrument can scan a specific spot in turn. The ASI team thought the integration of CAD and FEA would save them time and effort. The team used SolidWorks for design (CAD) and COSMOS/Works for FEA. With the integration of the two, ASI engineers did not have to manipulate CAD data to get it into a form suitable for FEA. Data transfer is automatic and does not require a file export and import. The result is iterations that take hours rather than days.

## Grinding Tool to Reveal Martian Rock

Rock Abrasion Tool (RAT)  
Honeybee Robotics, Ltd.  
New York, NY  
212-966-0661  
[www.Hbrobotics.com](http://www.Hbrobotics.com)

Honeybee Robotics is designing and building a robotic precision grinding tool for the twin rovers slated for launch as part of the Mars Exploration Rover (MER) project in 2003. The instrument is being created to bore into hard rock surfaces on the Martian landscape. By boring into the rock, the RAT will reveal fresh rock that will be analyzed by instruments on the rover. This assists scientists studying Mars by allowing them to go beyond the weathered surface of the planet and examine the contents of Martian rocks.

The RAT will be mounted on the rover's robotic arm, which will position the RAT against a rock to let it operate. The RAT will use low force and high speed to comply with the limited power supply available during the mission. The tool will be equipped with two diamond matrix wheels that it will use to scrape the rock surfaces.

In order to comply with NASA's regulations, the RAT will weigh less than 750 grams (roughly 1.7 pounds), be 7 cm (2.7 inches) in diameter, and only 10 cm long (less than 4 inches).

By using three small motors, the RAT will only use 30 watts of electricity. NASA's Jet Propulsion Lab (JPL) in Pasadena, CA is managing the twin rover mission.

*MSC.Software  
saves  
2 man-years  
in development of  
new Alligator.*

*MSC.Software slashes 3500 man-hours from new design*

Using MSC.visualNastran 4D, All American Racing was able to save 3500 man-hours in developing a production version of their new Alligator superbike. Its direct connection with SolidWorks models allowed them to quickly test the exact solid geometry that they were

using without rebuilding. The result? Over 76 virtual revisions alone to the rear fork and over two man-years of engineering time cut from the project.

To discover how MSC.visualNastran 4D can slash development time, visit [www.mssoftware.com/vn](http://www.mssoftware.com/vn) today.

# **What do you need to record ?**

## **Waveforms – Video – Audio...**

# **Dash 18® handles it all!**

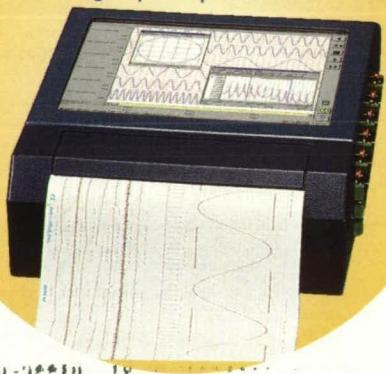

- Record waveform data, synchronized video snapshots and audio
- 18 Universal input channels for voltage, thermocouple and bridge
- 15.4" touch-screen display for data viewing and analysis
- Record data directly to 9 GB hard drive at 100 kHz per channel
- Real-time filtering and math functions
- 10/100 BaseT Ethernet interface and 250 MB Zip drive

### **Optional Printer**

For real-time recording or playback from memory, an attachable 10" wide high speed printer is available.
